A Citrus Orchard in Northern California

While the Citrus Industry is Largely Centered in Southern California, the Fact That the Central and Northern Part of the State Forwarded 2500 Cars of Oranges Last Year Shows the Wonderful Range Which the Industry Has

Courtesy San Dimas Nurseries

IN TEAGUE'S "Citrus Fruits," in which he gives a record of the past and promise of the future, we note this regarding the citrus north of Tehachapi:

While this development was going on in the southern counties, the American spirit of enterprise was not idle in other sections of the State. In the thermal belt of the San Joaquin Valley, from the southern portion of Tulare county along the base of the Sierra Nevada mountains, there is a vast area of country adapted to the orange and the lemon. Experimental plantings here and there gave early evidence of climate and soil conditions favorable to citrus culture. Notably true was this of the section of which the town of Lindsay is now the citrus fruit center. As a business proposition, oranges and lemons began to be planted in that locality about fifteen years ago, though experimentally and in a small desultory way citrus fruits were known in that neighborhood as early as 1862-'63. Last year (1906-'07) the shipments from Central California aggregated something like 2,000 carloads. For the most part the fruit ripens earlier than in Southern California, thus insuring an independent market which in no way conflicts with the industry as between one section and another. At present there are about 4,500 acres in bearing and fully 11,000 acres, both young and old, planted out. The quality of the fruit is in every way superb, clearly indicating that California's sunshine, soil and climate are quite as good in one section as in another. The natural supply of water in that region is ample, and warrants the prediction that at no distant date orange shipments will be as pronounced from that section as raisins are from Fresno.

Besides these two citrus growing empires within the borders of the state there is also what is known in the trade as the northern citrus belt. For the most part this is somewhat broken up or scattered over several counties, including Placer, Sacramento, Butte, Yuba, Stanilaus, Merced, Sonoma, etc. At particular points in all of the above northern and central counties, there are protected areas free from biting frosts in which citrus fruits find congenial conditions. Thus it will be seen that the orange and lemon, though rated as tropical fruits, yet find a wide geographical distribution in a state which is nothing if not a world unto itself for the growing of almost every fruit of the temperate and tropic zones.

The California Farmer and His Help

Observations by Mary Gray, of Santa Barbara, Who Finds California Employers Give Humane Treatment and, Under the Conditions, Are Fully as Considerate as Eastern Employers

AN IDEA prevailing in certain sections of the East that the California farmer prefers Chinese to white labor, and that when he employs white men is inconsiderate regarding their welfare, compelling them to sleep in bunkhouses instead of in the dwelling, as is the custom upon many eastern farms, that he supplies no bedding, and that he refuses the harvest hands and possible traveler even his barns to sleep in and that he furnishes poor, inadequate food; an eastern editor requested me to investigate these conditions.

A Personal Observation.

Since coming to Southern California I have visited in the vicinity of Los Angeles, San Bernardino, Riverside, Santa Paula, Ventura, Oxnard and Santa Barbara fifteen farms. The larger ranches of well-to-do people. I remained some days at several of these places and at nearly all of them my coming was unexpected.

At nine of the places the help ate with the family. At one the foreman's wife boarded the men. Two ranches had a separate cook-house and dining-room, and three had separate dining-rooms. Of this number I found but two where the food was not really excellent, wholesome, palatable and plentiful, well cooked and well served.

The first of these was where the foreman's wife boarded the men. The food here was plentiful and of fair quality, but ill-cooked and unclean. The owner of this ranch was away at the time.

At the other place scanty food ill-prepared was served the men in their separate dining-room. This was a large ranch with every appearance of afluence and prosperity where many men are employed, but do not remain long at a time. The owner of this property is an eastern man beginning upon his third year of farming in California.

Not Desirable in the Home.

At two places the men slept in the dwelling in comfortable rooms and good beds. However, I was informed by the housewife that owing to the floating element employed the plan, generally speaking, was not feasible. Five had tried having the help sleep in the dwelling and had found the experiment a failure. Considerable of their bedding had to be destroyed when the occupant ceased using it, and more disappeared when the occupant, like the Arab, "silently stole away." At two places I found the help's quarters in sheds and not comfortable, while the remainder had bunk-houses, unfinished for the most part, but well ventilated, clean and comfortable.

Well Educated.

Upon several ranches I met a very fine class of quiet, educated men who were generally satisfied with their employer and surrounding conditions. In most cases they preferred the separate dining-room and bunk-house in preference to the family dwelling. I observed a genial, good fellowship between employer and employee, and noticed that where there were separate dining-rooms the employer usually took breakfast with the help.

Races Preferred.

Of the number of ranchmen with whom I talked but one preferred Chinese, and this man was not, generally speaking, a Californian, he having but recently taken up a residence here. One man employed Mexicans, but had an American foreman, and one liked and employed Japanese. The remainder preferred white men and regretted that the scarcity of help compelled them to hire any other.

During the harvest season I found it true that in some cases men who follow the thrashers are refused the privilege of sleeping in the barns, for this reason: Nine-tenths of the workingmen in the West are addicted to smoking, generally cigarettes, and from this more than one farmer has lost his barns.

The farmer of the East who criticises his ranch-owning brother of the West does not consider that while he of the East permits his help to eat at his board and repose in his feather beds, he is in many cases harvesting his crops with the assistance of neighbors, or farmers' sons in his vicinity. In the West where the farms are larger with several different crops harvested and planted during the year, each man's constant attention is demanded upon his own place and there is no opportunity for this exchange of assistance, and the Californian in a country where good American farm hands are scarce is compelled more often than from choice to employ in his service Chinese, Japanese, Italians, Mexicans of the cholo class, white men recuperating from an overindulgence in liquor, together with an occasional box car tourist, working perhaps long enough to earn a pair of shoes.

Bee Ranches.

I have also visited besides the agricultural farms some twenty bee ranches, or apiaries, throughout Southern California. Many of these places are conducted upon a modest scale, but wherever help was employed I found good food and comfortable sleeping quarters, either in house or tent.

At the Piru apiary of M. H. Mendelson, one of the most extensive bee culturists in the country, I found all white help employed, no other being considered. Here I found food such as would be upon the table of any well-to-do home. Choice meats, fresh vegetables, fruit, fresh milk, eggs, good butter and desserts. This place is situated in a narrow, though pretty canyon, and inhabited only about five months in the year. The buildings consequently are small, though comfortable. The meals here were served in the kitchen, on an oilcloth, clean and white, with good china dishes and plated service. The owner always took his meals with the help.

In the bunk-house, as in many others, the bunks were built one above the other as in sleeping cars. In these bunks were bed springs, mattresses, feather pillows, good comforts and blankets, furnished by the employer, who, however, like the agriculturists in the valleys, found the supplying of these articles an expensive and often thankless task.

A Plunge Bath.

I talked with an employee here, a young man not long from England, who had many grievances regarding his employer. The food was very satisfactory, he said, his bed comfortable, his wages good, and his job the easiest he had ever held, but he wanted sleeping quarters with an upstairs, a porcelain bath with shower attachment, and a full length mirror. By the light of the moon during the wee sma' hours this man was visited unknown to his employer, by his fellow-emplyees and rudely awakened from his slumbers, given a ducking in the horse trough.

Better Than Back East.

After traveling over the greater portion of the United States I have found the Southern California ranch hand invariably treated with more consideration, receiving better wages, having shorter hours, and far more independent than his brother "hired man" of other places.

The poorest fed, poorest housed, and least complaining, also one of the most courteous and gentlemanly classes of men whom I encountered were among the cowboys of Texas, New Mexico and Arizona.

When farming is not made a study it loses dignity, and is no longer worthy of respect. The man who works without thought, works with little effect, and with results always disappointing. The work of every farm should be according to matured plans. Each farmer should have a map of his farm, which he can duplicate, and this should be planned for use. Plats of land of same kind should be placed together, and a record of the crops planted on each should be kept. Copies may be made with carbon paper, and a map filled in should be kept, bound with the other maps. We know one man who has a book of thin paper in which he keeps a plat showing each year's plantings and such memoranda as will be of use. It is time for farmers to be "business men." Order and system are necesary on the farm—as everywhere.

The almost world-wide movement to protect and establish forests has reached China, and the first Chinese school of forestry will shortly be opened at Mukden, according to a recent report by Consul-General H. W. Ragsdale, at Tientsin. The Chinese empire is usually pointed out as the worst example, among modern nations, of forest destruction. The floods which are periodically poured down from the denuded mountains are destructive beyond comparison with any other country, and the want of forests is assigned as the chief cause. Wood is scarcer in China than in almost any other region in the world, although the country is well adapted to the growing of trees. In the establishment of a forest school the Chinese government gives evidence that it realizes the need of beginning its restoration in a scientific manner.

Blessed is the owner of a few acres of God's green earth, for no panics can run away with his holdings. Banks may go down, merchants fail, but the man who owns a few acres of land is prepared to live in any event. Best of all property is the ranch or farm. Most independent of men is the farmer.

Hoarding Money

is popular now.

Many have become so conservative that no security is good enough to induce them to part with their funds.

When conditions return to normal much of this hoarded money will be brought out and invested. The opportunity will then be gone to take advantage of the low prices.

Sound securities are safer now than they were when selling at high prices. They yield better interest returns and present an exceptional opportunity for additional profit through advance in price.

Our six per cent coupon mortgages are first liens upon improved city property, and are exceptionally well secured. Intending purchasers may view this security and confirm our estimate of its value. These mortgages are as convertible as Savings Banks deposits, and pay six per cent per annum quarterly interest.

We invite a call or correspondence from those in need of safe and conservative bond or mortgage investments.

SOIL.

A writer in the Agricultural Journal gives the following definitions of soil:

A number of definitions have been given. The following are some of them: Soil is a part of the ground which can be tilled and in which plants grow.

The upper stratum of decayed rocks which is mixed with vegetable and animal matter.

The finely divided portion of the surface into which plants send their roots and from which they obtain much of their food.

The part of the surface layer which has been produced by the disintegration of rocks and to which has added more or less of the vegetables and animals.

No matter which definition the student accepts he must bear in mind:

First, that the part of the soil which came from the disintegration of rocks must be finely divided or well pulverized. The rock quarry and gravel pit contain materials which are found in the most fertile soils, yet the materials are unfit to become part of the soil because they are not well pulverized.

Second, that there must be a proper percentage of pulverized rock commonly called mineral matter in the soil. The manure heap, the peat bog or the soil of the barn lot contain too much vegetable matter for the amount of pulverized rock and are consequently, not the ideal soil.

Third, that there must be a proper amount of decayed vegetable and animal matter, commonly called organic matter or humus, thoroughly mixed with the pulverized rocks. The clay bank is an instance of finely divided or pulverized rock, but it can not be called the ideal soil because it does not contain a sufficient amount of decayed vegetable and animal matter.

Taking these requirements into consideration the following definition may percentage of pulverized rocks and de- be given: Soil is the union of a proper cayed plants and animals.

SOME SCIENTIFIC OBSERVATIONS

Dr. Leon Labonde of Los Angeles sends to the Cultivator the following observations on the sugar content of oranges: "I have been very much engrossed by the subject of citrus plants metabolism, which would account for certain peculiarities in the crop of certain sections where the same strain of trees are planted, and cultivated by the same rancher.

It is rather a bigger undertaking than I at first expected to arrive at the rational of respective sweetness and sourness of the orange and the lemon.

Cross pollenization accounts for more than I blamed it for in the first instance, but it does not account for the inversion of the cellulose-like material forming the unripe fruit of the orange into levulose, the parchment-like segments separating the sections must of necessity play a very important part in the work undertaken by nature, and if my first conclusions are substantiated by further observations, then these innocent looking little divisions are simply dialyzers, and the natural inference is that the production of invert sugar or levulose in the orange is not so much the product of plant metabolism, as the product of the plant influenced by plant food, soil, cultivation, etc., but the product of plant morphology, which in turn controls and causes the metabological changes which are evident to the senses when fruits of various degrees of ripeness are examined, the product of the same tree, and the value of careful observations in this field to pomology in its broadest sense is to my mind as likely of important results as the observations of Louis Pasteur in the science of fermentation.

It is but now, when both the great Pasteur and his life-long antagonist, the equally great Von Liebieg, have long since been amongst the world's most illustrious dead, that the greatest difference between these scientists can be adjusted to the satisfaction of both, and the claim of each that he was right acknowledged to the memory of each with perfect truth, and the full measure of justice rendered them for their monumental work on behalf of humanity.

The greatest difference between these two equally great men was the assertion by Pasteur that acidity was caused only by the living oxygen breathing organism, the bacterium aceti, and the denial of the theory as a fundamental truth by Von Liebieg. Both scientists had their followers, and Europe was split into two camps, each backed up by national pride claiming each other's work not scientifically correct.

FROST PROOF ORANGES.

A really frost proof variety of oranges, if good quality, would be a valuable addition to our fruit list. That some progress has been made towards the attainment of this desired end, is shown by the following item from the Tampa Tribune:

It will be many a long day before the memory of the terrible freeze in 1895-1896, which wrought such havoc to citrus fruit crops and brought ruin to so many growers, will pass from the mind of the people of Florida. Many of these are still struggling to recuperate financially from the almost fatal blow they received from the deathly breath of Boreas, while some have long since given up in despair or have died in comparative poverty.

Since those days very marked advances have been made in developing varieties of oranges that will withstand a temperature well below the freezing point, so that they may be exclusively planted in those sections which cannot be said to be immune from an occasional visit of very cold weather. The National Department of Agriculture has succeeded in producing varieties to bear a comparatively low temperature, but we learn through the New Orleans Times-Democrat of what are said to have been highly successful efforts in this direction on the part of an extensive grower, J. L. Normand, of Marksville. The Times-Democrat quotes from the Marksville Weekly News, as follows:

"Mr. Normand will also soon be ready to send an attractive collection of his frost-proof oranges, which he himself has manipulated by crossing them so that the trees producing these hybrids will stand a temperature as low as 10 degrees above zero. This variety he has named the "Carnegie" orange, and the public will be surprised to learn that it took him over twelve years to evolve this fine fruit to its present perfection It is a pleasure to take a walk over his experimental gardens and see the wonderful transformation he has accomplished by the scientific cross breeding of plants. One can see entirely new races of fruit bearing, and ornamental trees that exceed in beauty anything in cultivation in this part of the country. Mr. Normand's work is attracting the attention of the horticulturists far and wide."

It is evidently to the interest of Floridians to investigate regarding the foregoing statement, as the "Carnegie" orange might be a good one to show in the most northerly portions of this State.

FLORIDA ORANGES.

Regarding Florida citrus market conditions the Chicago Packer in reviewing trade at Baltimore said:

"The trade generally was dissatisfied over shipments, claiming the stock was far inferior to what was expected and for which there was a good demand. Most of the complaints came from Florida oranges and the statement was general and tnroughout the entire section, that the stock was far below the average grade and would not sell readily. As a result prices declined somewhat and it was comparatively easy to get the best stock on the market at under $3 during the first few days of the week's trading. Grape fruit was in better condition and brought fairly good prices. It is out of the question, however, to contemplate using the variety of stock sent by the orange growers, as a rule, to this port."

Also in same paper regarding ripening of fruit in Florida we note:

Wauchula has shipped, up to date, about 18,000 boxes of oranges, grapefruit and tangerines, against about 80,000 last year at this time, but owing to the later maturity of fruit this year there is still much fruit on the trees. Much of the fruit from this section going East is shipped via the Ocean Steamship Co.

WHERE THE FLORIDA ORANGE GROWER LOSES.

In a letter to the New York Packer, Wm. H. Earle, of Tangerine, Fla., says:

"I desire to call attention to some very important facts as to orange boxes.

"It is very strange that we should have for so long overlooked the difference in size of the California and Florida orange boxes. I have a letter from the secretary of the California Horticultural Society giving the legal size of the California orange boxes.

A reliable Florida orange packer writes me that a box of Florida oranges, 176 size, will fill a California box and leave besides 26 oranges. In other words, every six boxes of Florida oranges will make seven boxes if packed in the California size box, a loss to the Florida grower of one box of fruit in every six, in competition with California growers. To illustrate: If a box of California and Florida fruit sells at the same price in northern markets, 176 size, for $3.50, the buyer gets 50 cents more fruit if he takes a Florida box than if he takes a California box. Add to this the acknowledged superior quality of Florida fruit and these facts should stimulate the increased sale of our citrus fruits."—Florida Agriculturist.

The acknowledgment of the "Superior quality of Florida fruit" hasn't yet reached California, but lest it may, our citrus growers should take the same steps to "keep the peace" on the Pacific Coast which Uncle Sam is doing, and keep our oranges in the "16 battle ship class."

CALIFORNIA'S FRUIT WORTH TWICE AS MUCH AS HER GOLD.

Fifty years ago California was a mining camp. Today the value of the State's orange and lemon crop is equal to the product of her gold mines. Her total fruit crop is worth twice as much as her gold output.

The returns of the California citrus fruit crop for the season ending November 1st are just now available. They show the shipment of 27,487 carloads, worth about $34,000,000, an increase of 2000 cars over last year.

The market for this fruit is the East and Middle West. Only a fraction of the $34,000,000 worth of oranges and lemons could have been produced or marketed but for freight rates which enable the California grower to compete in any market with the growers of any other section.

The story of the development of the State's fruit trade is duplicated, though perhaps less strikingly, in respect to other products.

The California Board of Trade reports the average yearly product of the soil and the mines of the State as in the neighborhod of $358,000,000. Using round figures, this is divided as follows: Cereals, $39,000,000; other products, $49,600,000; farm animals and their products, $75,000,000; vineyards, $10,800,000; orchard products, $41,600,000; garden products, $6,200,000; minerals, including petrolum, cement and coal, $48,000,000; lumber, $72,000,000, and other forest products, $15,000,000. Wine production has trebled in twelve years, reaching 41,000,000 gallons in the past year.

MEAD'S PLACE FILLED BY GOVERNMENT.

The United States Department of Agriculture has rearranged the work of the irrigation and drainage investigation which has formerly been under the charge of Dr. Elwood Mead. Dr. Mead has recently resigned to assume direction of government irrigation work in Australia. Dr. Samuel Fortier, irrigation engineer in charge of the Pacific district of the irrigation and darinage investigations, and stationed at the University of California, Berkeley, California, has been made chief of irrigation investigations. Mr. C. G. Elliott, for several years past engineer in charge of the drainage investigations of the office, has been made chief of drainage investigations.

Several Southern California orange-growing sections are selling oranges to tenderfeet, allowing them to pick direct from the trees at 25 cents per dozen.

The government forestry nursery, located at Henninger's Flats, on the side of Mt. Wilson, is to be moved to Lytle Creek.

Orange is becoming more and more a shipper of vegetables, forwarding a special car of vegetables each day.

Snow is 50 feet deep in some of the canyons back of Redlands.

Imperial Valley will produce 5000 acres of cantaloupes next year.

Riverside is prosecuting "tree butchers" who multilate trees.

Live Stock and Dairy

COW COMFORT.

IN California we live in a so-called temperate climate. Yet, how we sit close to the fire and shiver evenings. The cows are out in the field or corral and the cold wind from the snow-covered mountains strikes them full force. The blood grows thin in California, and who does not find a warm blanket grateful at night. What about the cows? It takes more feed to keep them warm if no shelter is provided. While close stabling is to be deplored as practiced in the East, yet are we not going to the other extreme? In speaking with the veterinarians in the various parts of California, they all tell me of the numerous cases of congestion of the lungs found among the cows. Now, if a cow does not die from a cold chill, it certainly makes them more susceptible to tuberculus germs. This bacillius finds lodgment on abraded spots of the muscous membrane of the lungs, stomach or intestines.

Shelter From Cold Winds.

When the rain comes down in driving sheets and everything is wet and muddy, it is not easy to make cows clean enough to milk. Suppose they lie down in this mire to sleep? What a mess to be sure. When the clear starlight nights with the sharp winds that sting, the milk flow drops down, for the blood is used for furnishing body heat instead of making milk. Every pasture should have a shelter in it for the stock. On windy days the stock will be found seeking its shelter to chew their cud. A shed built at a trifling cost answers the purpose. Cut poles of any kind from the trees at hand. Stand these straight and put them down two feet deep into the ground. Cross poles are wired to the tops and then more cross poles, until they are every two feet across the top. Wire the poles at every cross pole to make it more secure. The roof is put seven or eight feet high at the back and twelve feet at the front of a shed sixteen feet wide. The low side is to the direction of the cold winds. The top, back and one end is closed in by using the brush from the trees or by making a thatch of palm leaves. Before standing up the poles, use the scraper and mound up the earth six inches above the soil to secure drainage in every direction under the shed. In many pastures are found spots of Johnson grass, Bermuda grass or Morning Glory; on one of these put the shed and the shed and the weeds will disappear completely under the constant tramping.

Barn Yards.

The sanitary barns are without a barn yard. One side of the barn is placed the long, narrow way for the cattle entrance. On the opposite end a like way is arranged for an exit. Now this keeps the cows away and no droppings fall around the barn. The rainy time when the cows stand all day around the barn they stamp the earth into mire, and when mingled with manure it becomes very foul.

These smells should not be around where the milk can is; it adds this effluva to its taste. Yet how accustomed the public is to manure flavored milk. A test of this was made a year or so ago. Milk was drawn and held in a sterile condition; then given to some people to taste. They were sure it was not good as it tasted flat. More milk was taken, some sterile. Of the two lots one had manure added to it; the other had some hair and scurf from the cards. After twelve hours the milk was again tasted. Four approved the manure flavored milk, while the other person liked the hair flavored, as it was nice and "cowy." None enthused over the flavor of sterile milk.

Paved Yards.

The round cobble stones in the washes around Los Angeles have an inviting look, for what could be better to pave around the barn. We will have the yards all paved when we learn to love the cows and the farm; these little things will come almost by magic when the pride of the farm center there. The heart's desire always comes when it is centered in material things. The stanchion is another survival of the days when cows were broncho; now that cows are gentle, there is no longer any need to truss them up in stanchions. I am using a modification of the Biddwell stall and like them very well. The cows are kept clean and the food is not wasted. These stalls have mangers; this feature is not up-to-date; I should modify that part if I was again building and put a flat cement floor in front of the cows. A couple of round iron bars would keep the cows from standing forward when eating and yet allow them to lie down well forward out of the gutter.

Pests.

Lousy cows are common this kind of weather. A little dry sulphur will help when dusted on the back, and sulphur and lard rubbed on the stomach and between the forelegs will further discourage these pests. Flies come in the summer time only, yet if the windows were screened these could be controlled, at least in the barn. Screened windows also, bring with them a further improvement. They stop the practice of throwing the manure out of the windows back of the cows. It is a vile practice, as it soaks into the wood of the side of the barn and makes a bad smelling place. The sides of the barn rot out quickly and the unsightly manure banks up to the windows. The odor is wafted in, not as ambrosia, and is taken up by the milk in the pail. I feel sorry that these things meet the traveler's eyes from the trains as he sees the high conical piles of manure at nearly every barn. What can he think of the California diaryman? A manure carrier swung back of the cows, running from the barn out to a wagon, and there dumping its load to be hauled out daily to the fields, is a labor-saving device.

New Year.

Every dairyman must make this New Year resolve: Clean milk. Clean ranch. Clean hands.

You think it would not pay? These things pay in the health of the cows. In the self respect and approval of your higher self. The time has come when the government is going force this care to save the health of its

Clean Skimming Means Good Living

The hog trough is no place to put butter.

Wide awake farmers want the cream separator that skims the cleanest. It means more profit—better living. That separator is the Sharples Dairy Tubular—the separator that's different.

Sharples Dairy Tubulars have twice the skimming force of any other

separators—skim twice as clean.

Prof. J. L. Thomas, instructor in dairying at the agricultural college of one of the greatest states in the Union, says: "I have just completed a test of your separator. The skimming is the closest I have ever seen—just a trace of fat. I believe the loss to be no greater than one thousandth of one per cent."

That is one reason why you should insist upon having the Tubular. Tubulars are different, in every way, from other separators, and every difference is to your advantage. Write for catalog S-260 and valuable free book, "Business Dairying."

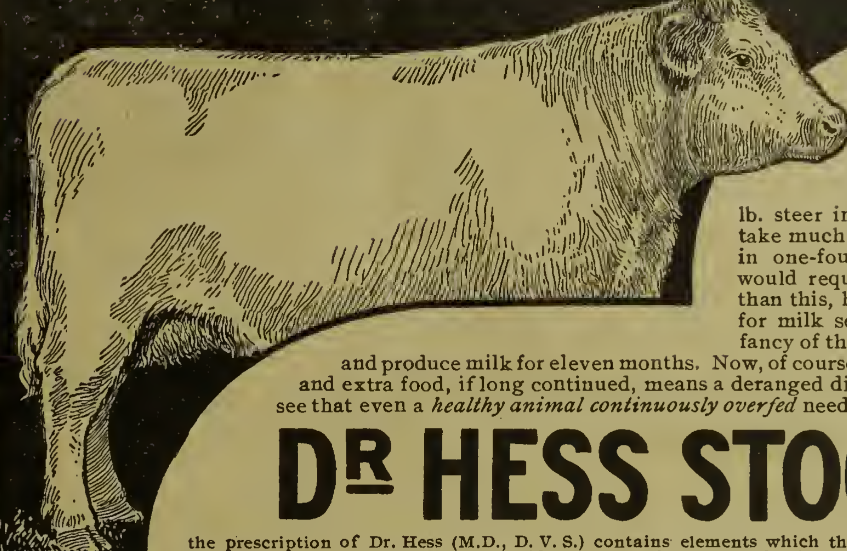
Do Healthy Animals Need A Tonic?



Probably not, if always permitted at liberty to secure such diet as Nature intended. We must remember, however, that the animal *domesticated* is subject to unnatural conditions. The feeder is striving to make a 1000 lb. steer in a year's time, when Nature would take much longer. He is making a 200 lb. hog in one-fourth the period unassisted growth would require for the same operation. More than this, he is asking the cow, whose capacity for milk secretion was limited to the brief infancy of the calf, to do violence to Nature's plan and produce milk for eleven months. Now, of course, extra production means extra food, and extra food, if long continued, means a deranged digestive system. Hence it is easy to see that even a *healthy animal continuously overfed* needs the assistance of a corrective tonic.

DR HESS STOCK FOOD A TONIC

the prescription of Dr. Hess (M.D., D. V. S.) contains elements which the most advanced medical science recommends for the conditions we are considering—iron for the blood—bitter tonics for digestion and nitrates to expel poisonous matter. It gives appetite for roughage, thus saving more costly foods, and by increasing assimilation saves nutriment that would otherwise enrich the manure heap. Dr. Hess Stock Food makes more milk, hastens the fatting of a steer or hog and is the best known tonic preparation for horses. **Sold on a written guarantee.**

100 lbs. $7.00; 25 lb. pail $2.00 Smaller quantities at a slight advance.

Where Dr. Hess. Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal compound and this paper is back of the guarantee.

Free from the 1st to the 10th of each month—Dr. Hess (M. D., D. V. S.) will prescribe for your ailing animals. You can have his 96-page Veterinary Book any time for the asking. Mention this paper.

people. The dairyman must be ready to respond to the call of "Where is thy brother?" Tuberculosis is a filthy disease. It is not polite to say so, yet is it not the producer of filth that necessarily secures a victim. The hovel in the slums poisons the rooms of the palace. Now, as dairymen, let us resolve that in this year 1908 we will begin by making the surroundings of the herd as clean as possible. That we will uphold the laws of sanitation. We will stand for "Clean cow! Clean corrals! Clean conscience!"—M. E. Sherman.

AMERICAN SHORTHORN BREEDERS' ASSOCIATION.

During the year ending October 31, 1907, the American Shorthorn Breeders' Association received 48,660 pedigrees, with fees amounting to $58,929, a gain of 1029 pedigrees and $2145 in fees over the previous year.

Three directors whose terms expired this year are re-elected. They are H. F. Brown, of Minneapolis, Minn.; J. F. Hogencamp, of Fort Worth, Tex., and J. F. Prather, of Williamsville, Ill.

ABERDEEN ANGUS ASSOCIATION.

At the recent annual meeting of the International at Chicago, the Aberdeen Angus Association elected the following directors: W. N. Foster, Attica, Ind.; Harvey J. Hess, Waterloo, Ia., and Stanley R. Pierce, Creston, Ill., to the Board of Directors. The board later chose W. J. Miller, of Metz, Iowa, as president; Geo. Kitchen, as vice-president, and elected Chas. Gray, the present secretary of the Galloway Association, as secretary.

AMERICAN POLAND-CHINA ASSOCIATION.

At the recent annual meeting of the American Poland-China Record Association, the following officers were elected: President, H. E. Singleton, McKinney, Tex.; secretary, W. M. McFadden, Chicago; treasurer, J. W. Blackford, Hillsboro, Iowa; directors for a term of three years, P. W. Patterson, Vermilion, S. D.; C. F. Dietrich, Richmond, Kan.; J. M. Stewart, Ainsworth, Iowa. The executive committee is: G. E. Leslie, Memphis, Mo.; Ed. Klever, Bloomingsburg, Ohio and J. M. Kemp, Kenney, Ill.

AMERICAN DUROC JERSEY SWINE BREEDERS' ASSOCIATION.

At the annual meeting of this association held at Chicago recently it was announced that 5866 hogs were registered during the year, an increase of 1882 over 1906. H. L. Igleheart, Uniontown, Ky., former vice-president, was made president; Edwin Hummer, Iowa city, Iowa, vice-president and T. B. Pearson, Thorntown, Ind., was re-elected secretary and treasurer. M. L. Wightman, Illinois, and R. C. Watts, Ohio, were elected directors. The capital stock was increased from 900 to 1200 shares.

PERCHERON SOCIETY.

The Percheron Society of America held its annual meeting at the office of Secretary George W. Stubblefield, at the Stock Yards, Chicago, recently.

The registrations for the year totaled 5521, of which 4888 were domestic and 633 imported animals. There were 2511 stallions and 3010 mares registered. There were 480 shares of stock subscribed by new members of the society during the current year.

The following officers were re-elected: H. G. McMillan, president; H. A. Briggs, vice-president; J. L. Delaney, treasurer; George W. Stubblefield, secretary.

SHOPSHIRE ASSOCIATION.

At the annual meeting of the American Shopshire Registry Association, Richard Gibson, of Delaware, Ont., was elected president for the ensuing year; H. L. Wardell, of Springfield Center, N. Y., vice-president, and Mortimer Levering, of Lafayette, Ind., secretary-treasurer. Three directors elected for a term of three years were G. Howard Davison, of New York, J. G. Hanmer, of Ontario, and H. A. Chandler, of Iowa.

SUFFOLK BREEDERS' ASSOCIATION.

At the annual meeting at Chicago recently, the Suffolk Breeders' re-elected the following: President, S. Melvin, Greenfield, Iowa; vice-president, James Bowman, Guelph, Ont.; secretary-treasurer, G. W. Franklin, Des Moines, Iowa. The Board of Directors, of whom there are three, elected for a term of three years, are: D. M. Cloyd, Dublin, Va.; W. C. Morse, Joliet, Ill., and G. N. Dean, Shelbyville, Mich.

TUBERCULIN TESTS DO NOT REDUCE MILK FLOW.

Dr. S. H. Guilliand, of Morutta, Pa., in a paper read before the American Veterinary Society, at Kansas City, Mo., in September, stated that in a series of experiments with 658 cows, that none of the healthy animals showed any decrease in the amount of milk they gave on account of the test. He said that there should be no fear on the part of dairymen to have their cows tested, for only the affected cattle would produce less milk on account of the test.—Hoards

Deciduous Fruit Culture

WALNUT GROWING IN THE NORTH.

The following by E . A. Epperson in the Alta Californian gives the views of a practical Northern grower on walnut culture:

"Perhaps it will be of interest to some of your readers if I call attention to the value, quick growth and bearing qualities of the French walnuts, the Franquette and Mayette. Both are claimed to be nuts that originated some two hundred years ago in France by the men whose names they bear.

"The Mayette is a rapid grower and a regular bearer. The shells of the nuts are very soft. The foliage is dense, thereby making a good protection for the green nuts during hot weather. The variety is late putting forth leaves in the spring, and is therefore seldom if ever injured by the late frosts.

"The Franquette in many ways is similar to the Mayette, with the exception that it is not so rapid in growth, and the shells of the nuts are not so soft, This hardness of the shells is an advantage when shipping. The meats of the two varieties are similar, both being very plump, of a sweet flavor and white in color.

"I have a tree of the Mayette variety that was planted in 1890. It commenced bearing five years later, and the last four years gained from ten to fifteen pounds each season. Last year eighty-five pounds of the nuts were gathered and this year there will be one hundred pounds or more. The tree has a spread of thirty-five feet, and is sixteen inches in diameter eighteen inches from the ground.

"To obtain the best results in growing walnuts, plant the California black walnut. Plant them three inches deep, with the point of the nut down. Put five or six nuts in one place, and when they have grown two seasons remove all but the largest. When the little trees are about an inch in diameter, or during the third or fourth season, they should be budded. Best results are obtained by budding from the 15th to the 20th of August. Cut the buds from the seasons growth close to the point where the growth begins and get the buds with small leaves. Use a clean, sharp knife and work as quickly as possible. Cut the bud from the limb, remove all the wood and put in place. Tie with tape one-fourth of an inch wide. After the buds have grown fast remove the tape and let them grow until next season. Then cut the branch off just above the bud.

"During the first season care should be taken that the wind does not break the branch off. It is sometimes necessary to tie them to some support during the first season. The trees should be planted at least forty feet apart, and sixty feet is even better, as they continue to grow and spread for many years."

SHIPMENTS OF GREEN FRUIT

Regarding the shipments of California fruits the following is from the S. P. railroad headquarters in New York:

During season ended October 31, 1906, 5930 cars of deciduous green fruit were shipped East from California. This season to November 1, 7048 cars. This has been a banner year in the green fruit business. California has received more money net than during any previous season. Many cars of fruit brought over $2000 each, while cherries in a number of instances ranged from $3000 to $5000 per car.

Total Northern California shipments of vegetables, green deciduous and citrus fruits during the season just closing have been 10,912 cars, or nearly a thousand more than last year. From Southern California shipments via all lines were 27,533 cars of citrus fruit and 3477 cars of vegetables.

The prospect for the present season is good. Since October 1, more than 450 cars of deciduous fruits and 1400 cars of oranges and lemons have been shipped from Northern California—a far greater number than during last year's corresponding period.

SLAKING LIME FOR BORDEAUX.

Many orchardists who use Bordeaux find trouble with the lime which improperly slakes thus clogging the nozzle. An observing orchardist at Orange writes:

"I have had a great deal of experience in the use of lime for various purposes, including spraying, and the plan of slaking here given will be found satisfactory."

He then adds:

The slaking of lime is generally considered a very simple process, yet there is a right and a wrong way of doing it. To secure the best results, put fresh stone lime into a vessel in sufficient quantity to take up one-quarter of the space, pour some hot water upon it and as soon as it commences to open and heat add cold water to cover and keep adding water to cover as the lime swells, stirring so that the mass will not "burn" or become dry-heated. Cold water may be used altogether, but the process is hastened by the use of hot water. As soon as the boiling process stops, cover and leave for ten minutes, when you will have a paste-like mixture and one that, when properly diluted, will strain well and will not clog the nozzle of the spray pump. Use only fresh stone lime. This process will give to the mixture the full strength of the lime. Perfection is secured by keeping the lime well covered with the water while slaking and getting the water to all of the particles as quickly as the lime will take it up.—J. F., Orange, Cal.

TO SAVE TREES FROM INSECT PESTS.

Besides keeping up the reputation of its fruit products by stringent rules that prevent the shipping af all fruits that do not come up to the highest standards of quality, Medford, Oregon, pear growers have reduced to a science the methods of fighting insect pests.

To discover just the right time to attack the codling moth, one of the greatest foes of fruit trees in that part of Oregon, a selected tree is completely surrounded by a wire cage, in which the moths are confined. By careful observation of their development it is possible for the grower to know almost to an hour when he should begin to spray all his trees so as to destroy the moth without injuring the fruit.

By methods of this kind Oregon fruit growers have raised the quality of their product to a point where they now command the highest

prices in the world's markets. Oregon pears have brought as much as $6.50 per box in New York during last season. One Central Point orchard of 16 acres produced pears worth $20,000. The highest record for production by a single tree was made by d'Anjou pear tree in the Medford district that yielded 45 boxes this season which sold for $5.60 a box, netting the grower $204.75.

Oregon's entire fruit crop for the year shows an increase in value of 53 per cent over last year or $4,275,000 for all fruits including prunes.

SULPHUR RULES TO BE ANNOUNCED SOON.

California dried fruit interests are now assured by Secretary of Agriculture Wilson, of definite rules regarding the use of sulphur in drying fruit. Representatives Needham, Hayes and Smith consulted the Secretary recently requesting him to go to the relief of the fruit men so that they might know just where they are.

The Secretary informed them that agents of the department are now in California buying dried fruits at grocery stores and sending samples to Washington for analysis. The Secretary said he expects to have full reports in thirty days, and that the rules governing the use of sulphur will be announced February 1.

SULPHUR RULING.

Dispatches from Washington say that Sec. Wilson has not yet received reports from the chemists and that more tests are to be made of sulphured fruits under varying conditions and it was expected that four weeks would be required. He would then pass upon the report and reach a decision as to whether the pure food regulations should stand.

Secretary Wilson said that the chemists have made several interesting discoveries which have changed their former opinions as to the injuriousness of sulphur to fruit. One was that the amount of sulphur diminished with the lapse of time and also in cooking. Therefore fruit was not to be judged by the amount of sulphur in it when purchased, but only when actually ready for use.

The secretary said that he wanted to assure the California people that he was not going to be swayed entirely by the scientists.

"We have to have scientists," he said, "but common sense is a good guide, too. If the report suits me I will approve it, but if it is not in accordance with what I think is common sense, I shall disapprove it. You can say to the California people that I will not be used as an instrument to close up the industries of California if I can prevent it."

The Californians left the department convinced that the fruit industry of the state would not suffer from the chemists' report.

FRUIT SHOW AT PURDUE

Great interest is being shown by the fruit growers of Indiana in the announcement that the State Horticultural Society is offering $300 in cash for premiums for the Fruit Show to be held at Purdue University, during the week of the Farmers' Short Course, Jan. 13-18, 1908. This money is being offered because the Indiana Horticultural Society feels that the resources of Indiana as a fruit state, and the possibilities for making money in commercial fruit growing are not understood as they should be by farmers of the state.

TREE OWNER SURPASSES ROCKEFELLER.

"In a few years nearly all the timber in the United States outside the government forest reserves will be exhausted, with the exception of vast tracts in the hands of one or two men, and each of these men will have wealth greater than that of Rockerfeller and Carnegie put together," said Secreary Wilson in an interview reported in the Washington Post.

"Rockefeller is now considered the modern Croesus," continued the Secretary, "but the lumber king of the future will far surpass him in the riches at his command. And why not? The forests of the West, through fires and the inroads of lumbermen, are disappearing year by year much more rapidly than they are growing. Generations must come and go before we can replenish the virgin forests of a few generations ago.

"One man in that country out there already has 30,000,000 acres under his control. We have only five times that amount under control of the government. We hold our supply to protect the watershed. He holds his for profit. In a quarter of a century from now, when the supply of timber is almost gone and the demand for it has vastly increased, think of what those 30,000,000 acres and perhaps more that may be added to them will be worth."

Secretary Wilson said he knew the name of the one man who had amassed this wealth of timber, but declined to give it. He said his own business was with the forests in the reserves.—Forestry and Irrigation.

FARM AND GARDEN LABOR SAVERS

The daily work of farmers, truckers and market gardeners isn't as hard as it used to be. The labor has been lessened and at the same time results have been increased. A man can get more bushels of grain or truck from an acre of ground today than he could a few years ago and he doesn't have to work so hard to do it. The adoption of up-to-date methods, in which the Federal Government with its experimental stations is aiding him, and the use of up-to-date tools, which the agricultural implement makers have put on the market, combine to take away the greater part of the drudgery that was formerly a necessary part of agricultural effect. Along this line nothing has contributed so much as the tools known as "Planet, Jr." These implements not only lighten and lessen farm work, but they save seed, time and money.

The No. 4 is only one of the many Planet, Jr., combination tools—there is one for every farm and garden task whether for hand or horse power—and all of them are sold with an iron clad guarantee of absolute satisfaction.

S. L. Allen & Co., of Philadelphia, make the Planet, Jr., tools and they issue a handsome catalogue describing them. You ought to have one of these catalogues, whether you think you need more tools or not. The book is generously illustrated with photographic scenes showing modern methods of farming and gardening as it is actually being done with the Planet, Jr., tools. If you will drop a postal to S. L. Allen & Co., Box 1106 P, Philadelphia, they will be pleased to send you one of these catalogues.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow Street, Los Angeles.

Fresno claims to ship out more of her own products as Christmas presents than any other section of the State. Her fancy raisin cartons, fig cartons and other products make very acceptable and distinctive presents.

The Ornamental Garden

THIS MONTH.

IF ANY have bulbs of lilies, fresias, narcissus, anemones, ranunculi or hyacinths they should be planted at once. Plant hardy annuals such as pansies, poppies, sweet peas, migonette, etc.

If the rains are uncertain do not let the garden shift for itself too long. Many who give plenty of water during summer care drop into the habit of regarding our "wet season" as wet enough to care for itself. Plants are often injured by negligence at this time of the year.

Spade in manure on beds to be planted later. Spade deeply and let air down into the soil. If the back yard lawn is not yet a reality, consider that, and how nice it would be, and spade in a thick coating of manure. Later it will be in fine condition for the seed.

Early planted sweet peas should receive the best attention in hoeing, watering and mulching.

This is the time to make rose cuttings. In the more protected section the weather has been hardly cold enough this season to make the plant dormant, but if care is used, good, ripe wood selected and cuttings put in sandy soil, a bunch of fine plants may be secured by planting rose cuttings now. Some varieties will never root, but most of them will.

Make cuttings the size of a pencil or larger, eight to twelve inches long and plant half their depth in sandy loam.

It is also easy to grow poinsettias from cuttings. The parent plant should be as near dormant as possible. After cutting the sticks to length, it will do no harm if the cuttings are allowed to lie in a shady place for a few days. It is even better to do so for they are less liable to rot the bark. The writer once forgot a lot of cuttings laid aside and they lay in the sun for two weeks and when planted every one grew.

THE LILY.

THE lily, designated the queen of bulbous flowering plants, is a genus of herbaceous perennials, found native, in temperate parts chiefly, in Europe, Asia, and America, a number of the finest kinds being natives of Japan and California. There are about 50 distinct species in cultivation, in addition to which there are a number of varieties of some of the principal kinds. The lily is certainly one of the finest genera of plants cultivated, the principal factors that conduce to its high position in the estem of horticulturists being the variation in height of the various species, the large and beautiful blooms of many and gorgous shade of color, and the long period during which the many kinds produce their flowers.

Soil and Situation.

The most suitable soil for the majority of lilies is a light and open loam that is thoroughly drained. A few kinds require a sandy, peaty soil to bring them to perfection but as a whole they thrive fairly in a sweet, unmanured, light garden soil. The most common cause of failure is undoubtedly the addition of fermenting animal manures to the soil they are grown in. Poor soils benefit by the adition of leaf-mould, or some very old cow manure in moderate quantity, but even in such soils if unmanured a fair measure of success is certain; while, if heavily manured with gross manure, the bulbs are nearly sure to fail.

A situation where the ground is shaded partially from hot sunshine is an important consideration. The majority of the lily family are found growing in forest regions and in garden practice it is found that they thrive best when lightly shaded from hot sunshine by being planted among dwarf shrubs or plants, or protected by a trellis. The earliest blooming kinds flower in spring, others succeeding them during summer and early autumn, and root action again begins after the flower stems die. In mixed groups and borders where the soil is maintained in a cool condition during summer, many kinds will succeed if undisturbed by digging and other gardening operations, and the soil is sweet, fairly porous, and unmanured. An occasional top-dressing of well rotted leaf mould is beneficial.

Propagation and Planting.

Lilies are propagated from offsets from the parent bulb—small bulbils that are produced in the axis of the leaves in some kinds, and occasionally, from scales of the bulbs. After the flowering is over and the stems die to the ground is the proper time to plant lilies and to effect an increase. The bulbs are practically dormant then, but soon begin to produce roots again for the following season, and an attempt to propagate after the roots are far advanced would result in damage to both bulb and offset. When the leaves on the flower stem have matured, the small bulbils occurring there on L. tigrinum and other kinds are ready for removal. They should be planted in beds of light soil, where they may be allowed to remain until large enough to produce flowers. Propagation from the outer scales of the bulbs is resorted to by nurserymen to increase certain kinds. The scales can be removed without damage to the bulbs and are sown in the manner of seeds when small bulbs are formed which are grown on as in the case of bulbils.

Autumn is the general season for planting most lilies. Trade growers lift the bulbs at the right season, replant the offsets at once, and store the bulbs in a cool, dry place, often in dry sand, to retard root action. Where an increase of plants or patches is desired the plants should be lifted after blooming, and death of the stem, and be replanted at once, but, unless an increase is wanted there is nothing to be gained by disturbing the bulbs. Lily bulbs should be planted at a depth of six or eight inches, according to size of bulbs, species, and soil conditions. Large bulbs of the taller-growing kinds may be planted at a depth of one foot with safety in hot but well drained soils. Fair room should be allowed for each bulb when grown in patches, about eight inches being sifficient for most kinds. In florists' garden some lilies are grown for the cut flower trade, the practice being to grow them in rows in cool soil and not to disturb them for years unless for sale of bulbs.

Selection of Kinds.

Several species of lilies may be procured from the local nurserymen or seedsmen, and will be found to be generally locally grown and acclimatized bulbs. Importing and acclimatizing lilies and other bulbous plants is not an amateur's work, and it is better to buy local bulbs. A fairly representative collection should include Liliums candidum, Brownii, croceum, Thunbergianum, longiflorum, tigrinum, and its varieties, splendens, and tigrinum fl. pl., auratum, pardalinum, speciosum, and varieties.—J. Cronin in Journal of Agriculture of Victoria.

The Vegetable Garden

THIS MONTH.

GET the hot beds ready for tomatoes, chili, eggplant, sweet potatoes, etc. In protected situations where the soil is a warm, sandy one, even potatoes may be planted this month. Top dress and spade deeply all beds for later planting.

Of course beets, lettuce, radishes, kale, cabbage, etc., may be planted now.

Cucumbers may be planted under frames, to be later taken out and placed in garden.

Berries should be trimmed up, staked and made ready for the new season. Plant new stock of raspberries, also blackberries, dewberries, etc.

Don't forget a few grapes. They may be had without the expense of a cent. The cuttings can usually be had for the asking and they grow so easily. But the few needed for a garden may be cheaply bought rooted and bear much quicker.

Your family orchard should be looked after, and if the list is not complete, buy the few trees and put out this month. Don't delay any longer, but get in the ground so that the roots are forming ready for the earliest start of leaf.

HOW TO PLANT ONION SEED.

We rented a nice piece of sandy soil out toward Glendale, and began the work of raising onions.

I did not know one man could be so many kinds of a fool, as the neighbors called me.

"Any one ought to know that onions would not grow in these interior valleys."

But the writer has great confidence in California soil, water and sunshine; and $2.25 a pound ought to buy good seed.

I counted ten persons who stopped to warn me of failure, because they had planted onion seed repeatedly without getting an onion.

Imitating the practice of the Italian gardeners, I combed out the side beds, to be free of trash, scattered the seed over the surface, as near two inches apart as I could, then covered with fine earth as near ¾ of an inch as I could; then firmed, literally tamped the whole down with a board.

I am quite sure I saw the man I had helping me put a stone in his pocket, at this stage of the game.

Then, in addition to a thoroughly dampened earth with which I started, I kept the beds wet—not just damp—but wet for the ten days the seed was coming up. I also soaked the seed for 14 to 16 hours before planting in the water I used to wet the beds, for sameness of temperature. I am confident I did not lose a seed.

The needle-like plants were very brittle, so care had to be taken in weeding. Also as soon as the young "shoots" were two inches high, I made a sieve of a box and wire screen and sifted a mulch on top of beds one-half or three-fourths of an inch thick.

Whether sown "broad cast" or in rows, the same rules apply, of course, Soaked seed, shallow planting in fine earth, the beds thoroughly "firmed" and kept wet until the plants appear from nine to eleven days, and success will come.

Few things pay so well as high-priced onions. Many a corner would help to a splendid purpose, if onions were planted there. And to raise onions successfully, be assured you will have to work; they take a lot of babying.

As this little paper is addressed to "new-comers," I want to add, do not judge California by back-East conditions. This sunshine, earth and water will raise anything in generous measure if you will do your part.—William R. Lee.

THE SELECTION OF SEED CORN.

The importance of properly selecting and caring for seed corn has been so thoroughly discussed and brought to the attention of farmers in every conceivable way during the last few years that there can be no adequate excuse for any corn grower neglecting to save a good supply of seed corn and put it up in a safe, dry place before killing frosts occur. It is not so much a question of what to do, or how to do it, but rather of getting started to do it. All observing and up-to-date farmers know well enough what should be done, but the habit of letting such things go until some other time causes many to allow themselves to neglect this important matter until it is too late to get the best results. There is plenty of evidence to convince even the most unreasonable man that the time to get the best corn is early in the fall, when it can be selected from the standing stalks and put away in a dry, well ventilated place before damaging frosts occur.

The great majority of farmers in the State do not get more than three-quarters of a full stand of corn in their fields and the result is 20 per cent less corn at harvest time than should be secured, without any more expense in producing the crop. The cause of the imperfect stand nearly always lies in the use of poor seed for planting. If every farmer in the State would get his seed corn properly stored by the middle of October, several millions of dollars would be added to the value of the corn crop next year.

A good way to do is to take a handy basket on the arm or sling a grain bag over the shoulder by means of a stout cord and go into the best and ripest corn field and go up an down the rows and select the best ears from the best hills, taking care to select only from stalks of stout development under normal conditions and which bear the ear in a good position. The selected ears should be at once put in a dry, airy place, where they can dry out naturally. Artificial drying should not be resorted to. When the ears are still sappy the application of artificial heat may easily do harm by inducing fermentation, a very little of which will injure the germs and cause weakness. There are many ways in which corn may be safely put up for drying. A good rack may be made of pieces of five or six-inch fence lumber set on end and common plastering laths nailed across the edges on either side opposite each other, spaced six inches apart to a convenient height. A single row of ears should be placed in each space at first, to permit of more rapid drying. Tying two ears together by the husks and hanging them over wires stretched a foot or more apart across a dry room is an excellent system for drying. Whatever the scheme used for drying, the important thing to keep in mind is that each ear must have a free circulation of air all around it. Putting the ears in bags or piling together in any way must be avoided. Seed corn should never be put into a building containing reach maturity an additional control is placed over the remaining pests. live stock of any kind because of the moisture given off by the animals.—A. T. Wianako, Agriculturist Purdue

CLEAN UP.

Here in California where we boast of so many beautiful things, and so many advantages, we are not careful enough about keeping our places clean. This is truer of the average farmer than we wish it were. The clean, well-kept ranch is the attractive one. Houses and out buildings painted, fences whitewashed, gates in order, no rubbish scattered around, these are evidences of thrift on the part of the owner, and if he wants to sell his place, add hundreds of dollars to its price.

We know a poultryman who isn't having the success in disposing of his stock he should have because he keeps such a "pesky dirty ranch." We asked him why he didn't clean up. "Oh, I can't afford to," he replied. Yet he is losing sales right along because people think his stock is dirty, too. They don't want to buy high priced poultry with mites and lice thrown in. They go to some other ranch, which is neat and clean, and purchase their stock. The other man grumbles that he lost the sale. Served him right. On this point the Journal of Agriculture reports an instance. A certain farmer who was also a raiser of fine stock advertised extensively in the journals. His offers were very good and he received a large number of replies from all over the country. But this man was always complaining about his losses. He couldn't get rid of his stock. A man who answered his advertisement and paid him a visit was asked why he made no purchases.

"Oh, the cattle looked fairly well," he replied, "but I have never seen such an untidy, dirty rubbish heap as that man kept his stock in. I wouldn't trust cattle that came from such a place, though they were apparently all right. It is just as easy to buy from those who maintain neat and clean quarters for their animals."

"In due time this remark came to the ears of this raiser, and he was asked why he didn't clean things up about his place 'Oh, that costs money,' he replied. Yet he was losing sales for that very reason, and this is a very good example of the false economy practiced by many farmers. The large merchants of cities spend enormous sums of money in putting elegant marble entrances to their buildings. While the farmer need not be so extravagant, he can keep up to the laws of sanitation at least and whitewash his fence even if it does 'cost money.' He doesn't need elegant stables or fine landscape gardening, but a periodical 'clean up' is a wonderful thing in the way of selling stock and other products."

Now, this is a splendid time to overhaul things on the farm, whitewash the out buildings and fences, gather up the scraps and cart them off the place. If the manure pile hasn't already been hauled out and scattered, and the barn yard made neat and sanitary, it should be done at once. The rains are coming along and the fertilizer will do good in the orchard and do harm in the yard. Turn over a new leaf with 1908, and clean up.

FARM INSURANCE.

We read recently of a serious loss to a farmer in Kern county whose barn was burned, in which was stored several hundred dollars' worth of grain. The loss ran $1200, and there was not a dollar of insurance either on the barn or its contents.

This brings up the subject of farm insurance, on which we want to express an opinion. It is a mistake in any farmer not to insure his house and barns. Not two-thirds of them do it, and they run too big a risk when they don't.

A farmer ought to be just as good a business man as the merchant, and what merchant is there who does not insure his stock against loss or damage by fire? It is true the liability of fire is not so great on farm buildings as on town houses, but the liability is there just the same, and it should be provided against. The rate is not so high as it is in cities and towns, and there is scarcely a farmer, in these days, who can not dig up enough money to pay a few dollars a year on a thousand or two insurance. If he meets a loss, his insurance will enable him to rebuild, and at the same time if he meets no loss, the satisfaction of knowing he has protection is worth a good deal.

Years may elapse and no fire break out, but let a policy once lapse, and somehow, and too often, a fire catches the negligent man and away go the earnings of a lifetime.

In California, sorry to admit the fact, our houses are not erected with the same care as in the east; chimneys are poorly put up and the liability of fire from defective flues is all the time present. Then, too, we are menaced by a horde of tramps which infest the country, sleeping in barns and out buildings, and these characters form an ever-present source of danger to the farmer. Just as farmers use preventive measures to protect their orchard crops, should they use measures to prevent loss by fire. It is the part of sound business policy to do this, and we repeat the farmer ought to be as much of a business man as the business man in town.

BIG PROFIT IN APPLES.

Thirty thousand barrels of apples were shipped from Boston to Europe in one week recently, and the announcement is made that Oregon growers have contracted all they have to sell at figures which will net them handsome returns. The present year has been disastrous to fruit growers, throughout the Middle West, and especially so to the apple growers. Apples have brought as high as $2.50 a box at retail this winter, and these were not the best grades either. This goes to show the value of apples as a crop, and it ought to incite farmers in apple districts to pay more heed to the care of their orchards.

We have fallen into the idea, somehow, that apple orchards do not need the attention other kinds of fruit do, and the result is, that our fruit has deteriorated in quantity and in price. The general shortage this year has had the effect to bring the price up to the high water mark. Some indication of the scarcity and value of apples can be obtained from the fact that Oregon apples recently sold on the New York market for 11 cents a piece. Of course, they were of exceptional size and quality. When apples sell for a greater sum than oranges, some idea of their value may be obtained.

If growers would give the same attention to cultivation and fertilization of apple trees that they give to orange and lemon trees, we would have a great deal better fruit and more of it. If apples will sell for 11 cents apiece, they are surely a bumper crop to raise. Of course, this is an exceptional year, but apples are standard fruit the world over and with our own population increasing so rapidly the demand promises to be in excess of the supply indefinitely.

The point we wish to make is this, the price at which apples sell will justify the raising of more of them and a better quality. This can be done by giving the same attention to them which is given to other crops. Discussing this subject with Mr. Thomas of Hawaii, recently, he gave it as his opinion that apple culture, in apple districts, will make the growers independently wealthy if the proper care is given the trees. In apple sections, now is the time to look after the orchard, for attention so given will go far to determine next year's crop.

FARMERS' INSTITUTES.

Farmers' Institutes not announced before for Southern California are: Buena Park, Jan. 9; Downey, Jan. 10; Montebello, Jan. 11. The ones at Buena Park and at Downey will be largely devoted to dairying.

The excellence of the work of the Department of Agriculture is being more and more appreciated, particularly in California, and those of our people who are interested in the productions of the State are realizing more and more fully its importance. The Bureau of Soils has been actively engaged in its particular line of work on the Pacific Coast, and the facts discovered and suggestions based thereon have been of very great value to all producers. Commercial and agricultural organizations are alive to the bearing of these investigations on the prosperity of California, and are on the watch for new directions in which the energy of the Bureau of Soils may be directed.

The Chamber of Commerce of San Francisco is making an effort to secure for the merchants of that city a part at least of the supplies for the Panama Canal work. Senator Perkins placed the matter before the Canal Commission and has requested that San Francisco dealers be recognized.

Shop Talk

To the readers of the **CULTIVATOR** who are interested in hogs, we have a word this week.

On page 18 you will see advertised the book **500 HOG QUESTIONS,** by L. H. Cooch.

We have arranged for quite a number of these books, and are going to make presents of them to those interested.

The only necessary stipulation is that in sending in your request, you enclose at the same time your subscription to the **CULTIVATOR** for the coming year.

This payment must be made direct to this office and should be sent in soon, as the books may be exhausted or the offer withdrawn. Remember, it can go only to those paying in advance, so if you are behind on subscription it will be necessary to pay up to date, and also the coming year. When one considers that answers to 500 different questions from all sources and of all kinds about hogs, are in this book, it is sure to be of great value to any hog raiser.

Send in your order for 1908, either a new name or a renewal, and tell us to send the book.

Agricultural Notes of the Pacific Coast

Northern California

Willows market was well supplied with blackberries for the Christmas trade.

The new dairy barn at the State University is under way. It will cost $20,000.

One firm will plant a vineyard of 320 acres near Arbuckle, Colusa county.

The cannery at Lincoln was destroyed by fire the day before Christmas.

Hop growers at Ukiah are signing by-laws of the new co-operative organization.

California leads all the States in the Union in the extent of forest reservation.

Yolo county is becoming a center of finely-bred horses, also of the dairying industry.

Coyotes are making life miserable for the poultrymen at Two Rock, near Petaluma.

Property owners at Wyandotte are protesting against the charge of $20 per acre for irrigating water.

State Engineer Ellery will travel over many of the levees of the Sacramento Valley on a tour of inspection.

One tract of 1200 acres is now being planted to sugar beets by the Alvarado Sugar Company in Yolo county.

Turkey raisers at Redding were paid 20 cents per live pound for large output of that stock for the Christmas trade.

Butter from Humboldt county has shrunk materially in the amount of shipments to the San Francisco market recently.

A rancher near Gridley is getting rid of rats by the use of ferrets. He succeeded in destroying 300 rats with three ferrets in one day.

An olive grower at Gridley has Sevillano olives, one of which measures four and three-quarters inches in circumference the longest way.

The rainfall in the Sacramento Valley is less than half as much as that of last year this date, but the condition is not so discouraging as before the last rain.

The City Trustees of Chico have decided to erect a large number of hitching racks for the accommodation of the increasing number of farm teams visiting the town.

The Santa Rosa Lighting Company has been sued to prevent it from discharging poisonous chemicals into Santa Rosa creek, by which it is said that many fish have been killed.

The directors of the Manchester Creamery Company in Mendocino county have decided to dispose of the company's plant and business at public sale Saturday of this week.

The resolution passed at the recent State Fruit Growers' Convention at Marysville favoring the repeal of the Chinese Exclusion Act has caused much comment among the newspapers of the State.

At a recent meeting of Woodland Creamery Association the following directors were elected: H. E. Coll, E. S. Farnham, Daniel Farnham, George Hoppin, J. L. Harlan, S. Lawson and A. W. Morris.

Central California

Many olives will be planted near Exeter this year.

A well-known seed man is to plant 80 acres of tomatoes near Turlock.

The raisin market is still somewhat unsettled by slow deliveries.

About two-thirds of Fresno and Tulare country oranges have been forwarded.

Dried fruit men, the State over, are anticipating a early decision at Washington on the sulphur question.

Dr. Arthur Paul, the government livestock inspector, is investigating the Texas fever tick in the upper San Joaquin valley.

State Forester Lull has been instrumental in securing a large number of convictions of setting fire to brush and pasture lands.

The fake rain making proposition in San Joaquin valley seems to be getting credit for all the rain which we have received this year.

A Fresno county paper puts the pertinent query as to why it is that live pork is 5 cents per pound good bacon commands from 16 to 25 cents.

The Sacramento Union says that the establishment of a fire patrol to reach from Tehachepi to Shasta would be worth a hundred times its cost to the State.

At a report on peach blight spraying made to the Dinuba Grange by committee, showed the results of experiments to favor a November and February spraying.

The Board of Trade of Tulare has inauguarated a good roads movement and hopes to benefit the roads from that place to Dinuba, Visalia, Porterville and other points.

The Kings-Fresno county division fight, which was supposed to have been settled by one election is to be conducted all over again because of alleged irregularity in the first election.

Owing to the non-appointment of the Board of Sheep Commissioners, the law recently enacted regarding collection of taxes on sheep has been declared by the Controller to be inoperative.

Beet growers at San Juan have held a meeting and passed resolutions asking for better prices for sugar beets, claiming that it will be impossible to raise them for prices given by the Sprecklеs people in the past.

An effort was made at the recent Counties' Committee great meeting at Fresno to start a movement to egt together all fruit growers in one great co-operative movement. If such a movement could be placed on its feet and honestly managed it would make a lot of good money for the producers of this State.

Dinuba Grange has elected officers as follows: Master, Mrs, S. Ramm; Overseer, A. E. Van Fleet; Lecturer, Mrs. Emma Nichols; Chaplain, J. N. Patterson; Steward, W. A. Bates; Asst. Steward, Warren Fraser; Treasurer, J. C. Naylon; Secretary, F. S. Clifton; Financial Sec., J. W. Fraser; Gate Keeper, S. Cedarberg; Ceres, Mrs. Mollie Perry; Pomona, Miss Allie Jones; Flora, Miss Mabel Dewhurst; Lady Asst. Steward, Miss Lizzie Patterson.

Southern California

Corona is to have a new creamery.

Redlands is contemplating a $12,000 storm drain.

Temescal is shipping large quantities of olives for pickling.

Up to Christmas Riverside shipped 154 cars of oranges; 48 of lemons.

Stockmen of Imperial county have organized for mutual protection.

The Glendora Farmers' Club held its first meeting of the season last week.

Large plantings of eucalyptus will be made at Beaumont during the coming season.

A movement is on foot to build a trolley line into Strawberry valley near San Jacinto.

Young grape vines on the Corwin ranch near El Centro, are said to produce three crops a year.

Owners of the lands in District No. 8, Imperial valley, are still waiting for water promised long since.

Riverside and San Bernardino counties are contemplating a road to be built to Riverside and Ontario.

The orange crop at Hemet this season is estimated to be about 80 cars or nearly 20 more than last year.

Ollie J. Watkins, the Rialto land swindler, was killed in a runaway accident at San Bernardino last week.

A walnut planter at Whittier has walnuts from a tree which are thought to be practically blight proof.

The town of Santa Paula shipped nearly 12,000,000 pounds of lemons last year valued at about a half a million dollars.

The Hemet reservoir closes the season with 110 feet of water, which will run for three seasons without further rainfall.

The work on the big dam of the Ventura Water & Power Company at Casitas has been discontinued until the dry season.

A large number of birds killed in fumigating orange trees has caused a protest on the part of officers of the Audubon Society.

A farmer near Westminister has a ten-inch well 681 feet deep which is said to be a wonder in the amount of water produced.

A large number of bees are being introduced into the Imperial valley under the expectation of the alfalfa lands giving good pasture.

Ranchers in many sections of Southern California propose to stop the unlawful waste of artesian water by having the law enforced.

The flow of water in the Colorado river at Yuma the middle of the month was 7700 second feet. This is much below that of last year same date.

The Pomona Fruit Growers' Exchange is building a new packing house near the junction of the main line and Chino branch. It will be supplied with a pre-cooling plant.

Great quantities of beans are stored in Ventura county, because of the market conditions brought about by the financial stringency. All growers are insisting on having close up to the five-cent notch.

The Coast

Seattle butter commands 36 cents per pound.

A new cannery is nearly completed at Granger, Washington.

Six hundred boxes of Hood River apples are now on the way to Siberia.

An orchard at Myrtle Point is giving its second crop of apples this season.

A Colorado beet grower is experimenting in raising a disease-resistant next season.

Spokesman Review says that it takes more brains to farm 10 acres than it does 50.

Many Colorado alfalfa growers are contemplating raising more alfalfa seed next season.

A campaign is to open to secure a distillery for denatured alcohol near Pullman, Washington.

Another large warehouse is to be built at Lewiston, Idaho, which will be over 500 feet long.

The effort to move wheat in bulk from Tacoma has been opposed by the shippers and exporters.

Twisp, Washington, is sending sample boxes of its fine apples to Secretary Garfield at Washington.

Five hundred cars of deciduous fruit were shipped from the little station of Freewater, Oregon.

Hops are leaving the growers' hands rapidly in the Northwest, but the price remains discouragingly low.

One artesian well has been struck near North Yakima, Washington, which is claimed will irrigate 160 acres of land.

After two weeks of scouring the country at Kiona, Washington, the "cayuses" were all rounded up and sent to market.

The seventh annual session of Inland Registered Breeders' Live Stock Association was held last week in Moscow, Idaho.

Palouse county, Washington, says that its last crop of wheat was the largest ever in its history and that it is practically all sold.

Complaints were made in some of the Northwestern stock sections regarding there being no more "free range" on government land.

Owing to the loss of fruit caused by shortage of cars, a Walla Walla, Washington, fruit company has sued the transportation company for $20,000.

The Northwest Horticulturist says that a better and more attractive label will be used on this coming season's output of apples than in the past.

Freewater, Oregon, has been more or less torn up over suits as to rights of irrigation water, which it is thought will now be settled by compromise.

A farmer at Pullman, Washington, has imported a number of fine breeding Duroc hogs for use on a farm where 500 head of hogs are raised annually.

The cannery at Clarkston, Washington, has just closed a very successful season, and in anticipation of greater output next year will greatly increase its facilities.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

SPECIAL PRICES ON TON LOTS.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

WINTER EGGS.

ALL of us have a desire to get eggs where the prices are best. Yet this desire only comes when we find that our eggs are not coming as fast as they should.

If we would get eggs in winter we should prepare before the rains and cold days set in. Even here in California it is necessary to make some provisions for the comfort of our hens. It will be necessary for them to be confined in the houses more during the rainy season than in the summer. They should have dry, comfortable quarters.

An Advantage.

There are reasons why we in California should be able to get better results from our poultry in winter than in the Middle and Northern States, for here it is not so cold, for one thing. Another important item is the feed; we have green food all winter, which certainly gives us an advantage over our Eastern competitors. Green food should form one of the important factors in our ration.

It is very necessary for us to know what constitutes a well-balanced ration so as to constantly supply the waste that is caused by the formation of eggs. We will gladly furnish to our readers a recipt for a balanced egg food if they will write us just what grains can be had in their locality. Unless we know this it is hard for us to give a balanced egg ration that will prove satisfactory to all.

Best Breed for Winter Eggs.

As to the breed we are to select to furnish us our winter eggs, leaving out a few that are bred strictly for fancy, there is no best breed, as most any of the popular breeds of today will give a goodly supply of eggs at a profit, if properly cared for.

Scratching Shed a Necessity.

We think it is necessary for best results to have a scratching shed as it will provide exercise for our birds; keep them contented working for food. If they have no such place they huddle together in the corners of the house. We have seen flocks of birds stand around apparentlly out of condition simply because they had been fed all that they could eat of a mash or whole grain. If they had been fed a small feed in the morning, then given a mixed grain in a litter, making them work for it, it would have been more profitable for their owner, and the flock would have been more content.

A Good Ration.

As we said before, it is hard for us to give a good balanced ration that will suit all, yet we quote from the Successful Poultry Journal a ration that will be found a good one:

Oats in the litter in the morning, mash at noon composed of equal parts oats and corn (ground,) bran and wheat middlings, to which is added beef scraps in the proportion of 15 pounds of the scrap to 100 pounds of the mash. Feed what the fowls will eat up readily. At night give a whole feed of corn or wheat in litter, alternating, one night corn, the next wheat. Green cut bone may be substituted for the beef scraps, but should be fresh cut and not to exceed one ounce per fowl per day should be fed of it. Oyster shell, grit and water must be regularly and continually supplied.

The mash may be fed dry from self-feeding hoppers if found desirable and the fowls given free access to it at all times, or it may be kept from them a portion of each day as appears to give the best results.

As will be seen the above ration is composed largely of the three staple grains and anyone should be able to procure it in nearly any locality. Fed judiciously it will give very satisfactory results regardless of weather conditions, although it is not strictlly a scientifically balanced ration.

* * *

We reprint from one of Dr. Cary's bulletins, what we consider every poultryman should have, and would suggest that this issue of the Cultivator be filed away or the following clipped for future use:

For Intestinal Worms.

1. Isolate infested birds and destroy or disinfect their droppings while being treated.
2. Put 1 to 2 drams of copper sulphate in each gallon of drinking water for one week; or
3. Powdered pomegranate root bark (for tapeworm,) followed by 2 or 3 tablespoons of castor oil; or
4. Oil of turpentine, 1 to 2 tablespoonfuls, followed in four to six hours with castor oil.
5. Powdered santonin in 5 to 8-grain doses is especially good for intestinal worms.
6. Chopped-up pumpkin seeds for tapeworms.

For Worms in Air Passages.

1. Turpentine introduced by stripped feather into the windpipe.
2. Steaming with creolin and turpentine in the hot water.
3. Feeding garlic in the food.

For Diarrhea.

1. Subnitrate of bismuth, 1 to 4 grains, two to three times per day; or
2. Pulverized cinchona bark, 1 to 2 grains three times per day, and
3. Quinine one-eight to one-half grain two times per day.
4. Dry feed or cooked and slightly moist feed.

Constipation.

1. Epsom salts, 20 to 30 grains in a tablespoonful of water; or
2. Castor oil, 1 to 2 tablespoonfuls; or

Poultry Show Dates

Los Angeles, at Chutes Park, Jan. 6-12, 1908.—Second Annual Exhibition Breeders' Association of Southern California. Dr. Winslow, president; H. A. Meserve, secretary. Birds will be received January 1st. Judged by score card and awards read before public is admitted Monday, January 6th.

Pomona, Cal., Jan. 6 to 11, 1908.—First annual show of Pomona Poultry Association. Write C. C. McKey, 372 W. 2nd St., for remium list.

3. Calomel, 1 to 2 grains, and
4. Soft feed.

For Lice.

1. Lard or vaseline over head, under wings and around anus.
2. Dipping in 15-per cent kerosene oil emulsion; or
3. Dissolving in 2 to 5-per cent creolin solution.
4. Pyrethrum powder dusted among the feathers.
5. Clean nests, yards and houses.

For Intestinal Disinfectant.

1. One-half to 2 drams of copper sulphate in 1 gallon of drinking water; or
2. One-half to 2 drams of iron sulphate in 1 gallon of drinking water; or
3. Salol, one-half to 1 grain, once or twice daily.
4. Naphthol, one-half to 1 grain, once per day after eating.
5. Resolein, one-fourth to one-half grain, once per day after eating.
6. Hyposulphite of soda, 4 to 10 grains in 1 tablespoonful of water.

For Chicken Mites.

1. Lard or vaseline on legs, feet and head applied once or twice per week. Wash off scabs.
2. Kerosene emusion sprayed on walls, roosts, floors and nests once per week for what is commonly called chicken mites or chicken ticks
3. Two to 5-per cent creolin solution sprayed on same places as 2.
4. Formalin, 1 part to 200 parts of water, sprayed as 2.
5. Corrosive sublimate (very poisonous), 1 part to 1000 parts of water, sprayed as 2.
6. Boiling hot water freely applied by pouring over walls, roosts, nests and floor.
7. Clean chicken house every day until mites are gone.

* * *

Rheumatism.

I have two young Plymouth Rock roosters about six months old which are troubled with something like rheumatism. The cords in the feet seem to be drawn till they can only stand on their toes, the center of foot cannot rest on the ground at all. When eating they sit on the knee, and are poor frame, not being able to scratch for food. They do not roost on a perch at all, but sit on a box.—Mrs. R. H., Grimer, Colusa county.

Your birds have rheumatism, which is usually caused by exposure and cold, damp quarters. Find the cause and remove it. See that your house is thoroughly dry and free from draughts. We don't mean by this

Killamite

Kills mites and lice and bugs of all kinds on fowls and plants and about the house. The best insect powder made. In sifting-cans, 10c, 25c and 50c. If your dealer hasn't it, we well send 50c can, or 6 lbs. for $1.00, expressage prepaid.

West Coast Chick Feed

A full, rightly balanced ration, to be fed dry. All pure feed, no filler, no waste; best made. Keeps them growing and healthy. For sale by dealers. If not by yours, send to us.

that a house should not be ventilated, as ventilation is necessary, but it can be done without causing draughts.

Treatment: Give a dose of epsom salts, about 20 grains, followed with about 30 to 40 grains of baking soda to a quart of drinking water, and give 2 to 3 grains of salicylic acid twice a day. Feed plenty of green food.

If fowls have been afficted long enough for the disease to become chronic, it is better to kill them than to try to cure them. We would rather try to find and remove the cause, than to try to cure the disease after it has once become established.

* * *

HARD EGGS,

Occasionally I kill a hen containing eggs—small ones—as hard as stones. Can you tell me the cause and the remedy?—R., Claremont.

The best answer to this we can give as a possible cause, is to quote the following from Farm Poultry:

"A Strange Case" has interested me greatly, as I have had some experience in that same trouble among my poultry, but I had settled the question for myself, believing I had found the cause of the hardened yolks.

In 1896 I came into possession of forty-two hens, which after a time I dressed for market, cleaning them for the cook. All but one were in perfect condition; that one having the entire bunch of eggs very hard, and all enclosed in a sort of sack. I have never seen anything like it since, but have had many cases of hardened yolks, and yolks loose among the intestines.

For a few years I kept a few hens and found no hard yolks when the poultry was dressed for my customers. I increased my flock to such an extent that I was obliged to have help to care for it. In 1903 I took a thirteen year old boy to help. He did pretty well, but things began to get stirred up, and the hens were not as quiet as formerly. I do not remember the internal state of the poultry dressed while he was with me, because I had not at that time associated a boy and hard yolks together. Two years later I had an eighteen year old boy; he was quick motioned, and in a hurry to get through the poultry work to get at the farm work. The hens became nervous, and ran away rather than towards us, and did not lay very well, and I began to find hard yolks in dressing the poultry. My latest and last (I hope) helper was a fourteen year old boy, good in many ways. The hens irresponsible in some ways. The hens under his influence became so wild that when any one of the family walked by the hen runs the poultry would run and fly to the opposite side of the yard, often beating against the wire in their haste to get away from whoever was near. This boy in feeding the hens would sometimes get a lot of them together eating what he had put down for them, then he would throw the feed pail in their midst just to see them fly and flutter.

It was while he was with me that I came to the conclusion that these sudden frights and starts caused the trouble with the egg cluster, for the hen without hard yolks was the exception whenever I dressed any of those fowls. I talked to the boy and explained to him the effect of roughness and too much haste in moving about among the poultry, and I showed him the hardened yolks. I had one pen of nine Indian Games that became so wild they would break a window glass in trying to get out of the hen house when I entered it, and they stopped laying. I decided to kill them. After I had dressed them the boy asked if I had found any hard eggs in them. I told him I had. I believe he had done something, perhaps many times, which spoiled these hens as layers. Certainly I did not have hard yolks until after the hens had been well stirred up and scared. I do not blame the boys for all the trouble, for I more than suspect that I caused a share of it, at least in a pen of Plymouth Rocks. Sometimes a customer would come and insist on having a hen or two immediately. I could not induce such ones to wait until night and then come when I could quietly pick the hens off the roosts. Rather than lose the trade I would get a wire and catch them by the leg as they went past me. The hens very soon found out what I was doing, and kept away from me. Then I slowly followed them about and worked until I caught what I wanted. It scared them, however, and they rushed with more or less haste into the corners. In less than a week the hens stopped laying. I did not dress any of that pen at that time, but sold them alive, so I did not know the state of the egg cluster.

I have sent the boy away, and have sold every hen and chicken I had on the place, and next spring intend to begin all over again, keeping only as many fowls as I can care for myself. I will not catch any for a clamorous customer, and if then I find hard or dead yolks I shall believe I have not found the reason thereof.

Grangers at Albany, Oregon, are agitating for the enactment by an initiative petition of a Constitutional Amendment providing for a two-cent rate on railroads in Oregon.

This is the time of the year to use the Success Automatic Nests, to designate the prolific layers. The Success (no lamp,) Incubator Co., of White Salmon, Wash., are the manufacturers.

Smith & Darling, Proprietors

Bees and Their Care

TREATMENT OF FOUL BROOD.

THERE are three methods of dealing with foul brood and are given by the Journal of Agriculture of Victoria, Australia, as follows:

1. Destruction.
2. Elimination of the disease.
3. Chemical treatment.

1. The destruction of bees, combs, hive and fittings is, of course, an effective method and where only one or two hives are affected and the disease is of a maligant type, it is, perhaps, the quickest and best method to adopt. It is, however, wasteful, as the bees, wax, hive and frames destroyed have a value of from 10s. to 30s., and the utter destruction of the diseased colonies is no guarantee against the appearance of the disease in other and new hives even though all hives, healthy as well as diseased, are destroyed. Destruction, usually brought about by burning the hive, bees and all, after all the bees have returned for the night, is, therefore, not to be commended, except for an odd case of a virulent nature.

2. The elimination of the disease is effected by removing the bees from the infected hive and combs. Put them in a temporary hive placed on the spot occupied by the old one previously, and leave them without food for 24 to 48 hours, but with the exception of the queen allow them liberty. The queen may be caged to prevent the bees swarming out and absconding, or, as they will sometimes do when deprived of brood, entering a neighboring hive. The cage employed for this purpose should have an opening, covered with a piece of queen-excluding zinc such as is used in honey boards which will prevent the queen leaving the cage, but will allow the workers access to it. Otherwise the bees are to all intents and purposes queenless and may leave the hive. After the lapse of 24 hours they may be fed with syrup made by dissolving sugar in an equal weight of boiling hot water, the syrup to be given warm (about blood heat) and if there is a scarcity of nectar, not till after sunset, so as to avoid attracting robber bees from other hives. If a honey flow is on, feeding may be dispensed with. In three to four days the bees will have built some pieces of comb on the bars of wood which, instead of frames, have been placed in the hive and from which the cage containing the queen is suspended. The bees may now be returned to their former hive which in the meantime has been thoroughly cleaned by being immersed for several minutes in boiling water in which soap and soda have been dissolved, and allowed to dry in the open air. If the same frames are to be used again they should, after the combs have been cut out and boiled down for wax, be treated in the same way. When properly dry the frames are supplied with starters or full sheets of foundation. The temporary hive is moved aside, the cleaned hive with the frames put in its place, and the bees transferred to it by shaking them out on to a cloth placed in front. The queen may be kept caged with advantage for a day or two more till the bees have again settled down and commenced to build comb. If any comb has been attached to the cage it will be best to transfer the queen to a fresh cage. The comb built by the bees during their stay in the temporary hive is treated as infected and boiled down.

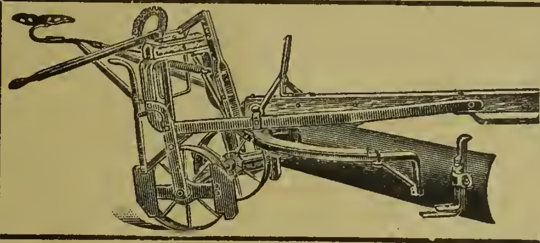
If the bees cannot obtain a liberal supply of nectar from flowers immediately after this treatment feeding should be continued for a while, because although they may not be actually starving it is necessary that they should raise the greatest possible amount of brood immediately after being established in the clean hive, otherwise the small number of bees emerging from the new combs after twenty-one days will not be sufficient to replace the old bees when rapidly disappearing from old age.

It is not absolutely necessary that the bees should build their own combs. Instead of frames with foundation, finished combs, stored with honey and pollen, may be given from clean hives which have a surplus and as soon as there is brood in these a comb of sealed brood from another hive may also be given them. This will dispense with feeding and prevent the colony declining too much during the first three weeks after treatment.

DO NOT LET BEES GET HUNGRY.

It pays to feed bees at any time of the year when they are short of stores. One reason is that it stimulates brood rearing and at times is the only thing that will prevent the brood from dying. It frequently occurs during a short honey flow that the brood dies from starvation when the owner thinks the bees are suffering from some disease. In such cases the only treatment needed is feed. Another reason for feeding is it puts new life in the old bees. Bees, like men, sometimes become discouraged and give up the fight, but it is astonishing how a little feeding will put new life and energy in the entire colony. The old bees hustle out and hunt nectar, the queen begins to lay, and everything becomes lively and active, while before feeding all were listless and seemingly indifferent to the fate that awaited them.

Where an apiary is run largely for comb honey there will doubtless be more or less unfinished sections of honey, and to leave them in this condition over the year is not desirable. Some recommend feeding back extracted honey after the honey season is over and thus have them completed. Principle objection to this is that it has a tendency to produce robbing, especially in a large apiary, so much as to endanger the loss of colonies. A more desirable plan is to uncap the unfinished sections and extract them, placing them back in the hives, and have the bees to clean them up thoroughly. In this condition they can be carried over in good shape and be ready for use the next season. Bees will more readily accept and occupy them, and an early crop of honey will be the result.—Emerson Taylor Abbott, in Modern Farmer and Busy Bee.



The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine strait ahead. The moldboard is six feet long. Has adjustable shoes shown at ends of moldboard to gage depth to which moldboard should cut. It's a very desirable machine for road-building in city of village. It makes good roads and keeps them so. Although made of steel and mallable iron, stlill it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front of wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, Ditching, Land Leveling, Foundation-digging,

For Irrigation, Canal Building Etc.

The price is lower than most such machines. We send it on free trial. Write us for our handsome booklet., "Delightful Roads." It's free and tells you all about the 20th Century.

500 QUESTIONS ANSWERED ABOUT SWINE.

500 HOG QUESTIONS ANSWERED

A Copy of the Latest Authoritative Veterinary Swine Book. "Five Hundred Questions Answered ABOUT SWINE," Is Almost Certain Hog Insurance.

This latest Manual for Hog Breeders and Feeders, just published, actually contains answers to 526 live questions, which were really asked by Hog Breeders within the past five years.

The questions relate to Breeding, Mating, the Choice of Breeds' Feeding, Fattening, Management, Diseases, etc., of Swine. The questions and answers are carefully arranged and the complete index enables one to find at a glance the answer to the question he has in mind.

The Veterinary Department is so complete that a copy of this book in the hands of a breeder will pay for itself many times over in saving one pig.

INDISPENSABLE TO EVERY HOG RAISER.

The answers to questions on Feeding contain information which will put enough extra pounds on one pig to pay for a dozen books. Multiply this by the number of hogs you own and figure out what the book is worth to you.

Even the answer to just one of the 526 questions would cost you nearly 25 cents in time, letter writting, and postage stamps, besides the loss you might stand while waiting for the answer. The information and answers are wholly dependable and come from the practical experience of the largest Swine Breeders and Feeders in the West and the most authoritative veterinarians.

Sweet Potatoes.

I would like some general information regarding truck gardening. I have light, sandy soil, with lots of frost at this time of the year. Please give information regarding sweet potatoes, especially the bedding of the potatoes for plants. Would you recommend planting the slips or let them vine and plant the vine? Should they be planted on ridges or on level ground or in furrows; about how many potatoes should be bedded for each acre to be planted?—Chris. C. Walker, Riverside.

Light, sandy soil is generally good for melons, cucumbers and sweet potatoes. If it is made very rich, it makes ideal soil for onions.

For growing sweet potato plants, select some well sheltered spot that will get the sun most of the day. Often such a spot can be found on the south side of some building. Spade up the soil 8 or 10 inches deep, making it as fine and mellow as possible and rake it level. About the first of April select medium sized sweet potatoes and place them upon this bed of soil quite close together, allowing about half an inch space between the tubers. If some of the tubers are quite large cut them in two lengthwise and lay them with the flat side down. If the bed has been made along side a building do not make it more than four feet wide, as it will be hard to reach the young sets later on. I have overcome this objection by setting up two boards parallel with the building, allowing the board next the building to be 18 inches or 2 feet away so that one can get between it and the building. These boards need be only about 8 inches wide and no matter if the bed is 8 or 10 feet wide, you can lay a heavy board across the bed upon which to stand when getting your sets. After your tubers have all been placed, cover them with clean, fine sand to the depth of about 1½ to 2 inches and give them a thorough watering with the sprinkler. Do not water too freely after this first time, until the sets begin to show up through the sand, but on the other hand examine the soil every day to see that it does not dry out. After the sets begin to grow the bed can be watered more freely. Some growers plant the sets out in the field as soon as they are large enough, while others go over the bed from time to time and break off the sets from the potato, allowing the potato to remain in the bed, and transplant the sets very close together in rows. They are set a couple of inches apart in the row and the rows can be any width from 12 inches up. If the soil is very sandy and they are freely watered and kept well watered, they will throw out a mass of fibrous roots that makes it an easy matter to transplant them into permanent quarters. I think it pays well to pursue this latter method.

They are always set on ridges which can be about 2½ to 3 feet apart. These ridges can be made quickly by putting a large single shovel on a one-horse cultivator. If you would mark out your ground first, making the lines the distance apart you want the ridges to be, you would find it easy to make them straight by walking the horse on the line, provided, of course, you have made four lines straight. As the tops of the ridges made in this rapid way will be somewhat uneven, it is well to go over them with a rake. Then set your plants along the top of the ridge about every 15 inches. Set them pretty well down in the soil and leave a basin around each plant that will hold from one to two pints of water. Have some one follow the planter and water each plant. Go over the next day or soon as dry enough and level in the soil around the plant. The after care will be to keep the field clean and give water as needed. As to the quantity of seed per acre, it will depend upon so many things, that it is difficult to name any exact quantity. The skill and experience of the grower counts for much. It will range from two to four hundred pounds.—Q. A. L.

Pumpkins for Cows.

Do dairymen generally dry off their cows for several weeks before they become fresh? If so, for how long? If a cow has milked for two years, does that make it more necessary for her to have a rest? About what is considered the proper interval between calves? What is the value of pumpkins as cow feed? R., Clarement.

Usually six weeks. I should not try to dry off a cow that was giving three gallons of milk a day. No, it is not necessary, some cows milk seven or eight years continuously. This depends on the use the cow is put to. In a breeding herd cows produce a calf every year. In milking herds often milk two years between calves. Sometime when a cow is of great value as a producer of calves she has a calf every ten or eleven months.

The value of pumpkins is two dollars a ton for ordinary ones; two and a half for crook-necked squash. They add succulency to a cow's feed. They are fed from ten to thirty pounds a day. Cut them up and sprinkle bran over them. Give only a few pieces at first and increase up to full feed. The pumpkins are fed always with grain and some long hay. Fed as the only feed a cow would starve on them.

Knot Worms.

Can you give me a recipe that will cure vomiting? We have a dog that is troubled with vomiting every half hour. He gets fed three times a day and still he is hungry. L. K., Suisun

Your dog is troubled with knot worms. Do not feed him meat and confine diet to bread and milk, in which give three disks of Nux Vomica twice a day. A physic of Castor Oil should be given—1 ounce. This treatment to be every day for three days. This will bring away the worms and the Nux Vomica will aid digestion.

That poultry essay contest is one of the most liberal propositions of the kind. Do not neglect it.

Loss of Milk.

We have a cow fresh about three months ago. Big, fat and in good health. Feed her 2 quarts bran twice a day and all the alfalfa and oat hay she will eat, and she gave about three gallons milk a day, till suddenly, two nights ago, she did not come up for her feed at milking time, and one teat seemed a little swollen. Next morning that teat had very little milk and only a quart in rest of bag. Now that teat is dry and the rest give very little. The bag is soft, as usual, except the dry teat which is harder than the others, though not caked, apparently. Mrs. H. R., San Dimas.

Are you sure some one or something is not milking this cow. We have had cases of this kind occur at night from tramps taking the milk. Try keeping her under observation for a day, she may be milking herself. When the appetite returned the milk flow should come with it. M. E. S.

Indigestion.

I have two horses that have been troubled with chronic diarrhoea or scours for six months or more; the one case nearly a year. I have tried various remedies, all to no purpose. They are both about 15 years old and have had their teeth dressed recently, two or three months ago, but there is no change for the better. They are both at work every day, but are unfit to drive on account of the looseness of the bowels. Am feeding alfalfa hay and barley. Have fed grain hay (wheat) with no changes in condition. They have access to salt. O. J. Vine, Lindsay.

Your horses have indigestion. Reduce the amount of hay feed and give the following:

1 ounce powdered charcoal.
1 tablespoon bicarbonate soda.
1 teaspoon ginger.
In bran morning and night.
Water 30 minutes after feeding.
Cover at night to keep warm.

Pecans.

What kind of climate and soil is necessary for growing pecans? Do you think Sonoma county would grow them, citrus and deciduous fruits thrive here. Subscriber, Sebastopol.

Pecans do better where the summer temperature ranges higher than it does in Sonoma county. The trees will grow well enough, and are very valuable as a symmetrical avenue tree, or for timber, but to mature the nuts in good season, the Sacramento-San Joaquin Valley, or the small interior valleys in Southern California, would be preferable. A deep soil, with abundant moisture is required. Pecans would thrive in Sonoma county, but not as a commercial proposition for the production of the nuts. Leonard Coates.

Moles.

Will you kindly answer in your query column if "moles" do any harm in an orange grove. Their runs seem to circle the tree trunks. Is there any thing else that leaves a track like a mole?—W. David.

We have never heard of any injury from moles to orange or any other trees. They live almost entirely on insects in the soil. We would surely allow them to remain in orchard till shown conclusively that they do damage. On lawns they do damage by throwing up ridges. In orchard we think they would be beneficial. But don't let a gopher live a minute. The gopher throws up his dirt in little mounds, while the mole forces up little ridges as he burrows his way after insects just under the surface.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Bloody Milk.

I have a cow whose milk, from one quarter of the udder, is mixed with blood for the last two days; there is no inflammation in udder nor is it from a large flow of milk. I found traces of blood several times during the last three months. —A. B. C.

A broken blood vessel in the udder cannot be treated. Sometime when the cow goes dry they heal naturally. The usual practice in these cases is to use two milk pails and either separate or set the milk containing the blood for cream. When it is set the bloody portion remains in the bottom of the pan.—M. E. S.

Inflammation of the Kidneys.

I have a horse and mare coming two years old next spring that are stiff in hind quarters and walk with hind legs slightly straddled. The horse seems worst and when standing will occasionally lift his hind feet as though in pain, but aside from that they seem to feel well and eat and drink as usual; have been running on river bottom pasture until a couple of weeks ago, when I put them with others on short alfalfa pasture. They look gaunt and tucked up in flanks. The horse sweats quite freely, especially in flanks and hips, but the mare very little; the pulse of horse is from 75 to 80. W. B. W.

I think your horses have kidney trouble; may have been strained. There are so many causes for this condition, and so many remedies, I would advise a veterinarian.

Worms.

I have a mare about twelve years old without a very good appetite, slightly falling off in flesh and drinks lots of water, which makes bowels very loose. Her teeth have been looked after. G. E. P.

Your horse has symptoms of intestinal worms.

Give a pound of Orleans sugar in two quarts of bran twice each week for two weeks.

On alternate mornings use the following: Baking soda, powdered ginger, powdered gentian, wood ashes, equal parts—one ounce at a feed, in bran mash (light) cut out grain for a time and feed equal parts of alfalfa and clean oat hay.

Water 30 minutes after each feed and blanket at night, covering thoroughly.

Follow these directions for two weeks and report.

Defective Hay.

Will one of your writers please tell me through the columns of the Cultivator what there is about alfalfa hay that is well cured, green and nice (third crop and clean, except a very litle alkali weed and morning glory which grew only in spots) that would cause colic and inflammation of the bowels. I have lost two horses and had the third, a yearling, sick three times. I would keep him up four or five days and he would take sick. Then turn him out and he would be all right until I would keep him up again. My neighbor has lost two and had the third one sick. Kindly advise a remedy and oblige. B. M. C., Yuba City.

There is nothing in these named foods that horses are not eating in many other parts of the State without ill effects. I should think there was something else ailing these animals, perhaps some intestinal worms or something of that nature. Write to Dr. Haring, Experiment Station, Berkeley, for advice.

A telephone line has been constructed to the forest reservation in the Arroyo Seco near Salinas.

The
Brust Portable Derrick
Has been in practical use for the last five seasons, in which time it has proven itself to be far superior to any like Stacker on the market, and has taken the place of many other Stackers in all parts of California, as well as in other States, as they will save their cost many times over in a single season's labor on the farm.

We build these derricks in two sizes: No. 1 is 30 feet and No. 2 is 38 feet to the point of the boom from the ground.

CALIFORNIA'S CHRISTMAS.

The old glad bells of Yule ring out
To skies of azure hue,
And all the happy springtide land
Smiles upward to the blue.

The odor of the violet
Is on the southern breeze,
The sunshine glistens on the green
Of dark magnolia leaves.

The pepper trees have hung their boughs
In rosaries of red
And stately palms are whispering
Together overhead.

A thousand lily cups are filled
Brimful of wassail cheer,
And feathered minstrels fill with song
The festal atmosphere.

Within the shelter of the hills
The holly bushes glow,
While dreamily above them sway
The oak and mistletoe.
—Janette Campbell, in Sunset Magazine.

THE VOICE THAT CALLED.

The following original story for the Cultivator, was written by Julia Hughes Persing, and should have been in before the Christmas time, but owing to crowded condition of the columns was held till this issue.—Ed.

THE spirit of the Yuletide seemed drifting and floating everywhere. It stole upon the keen, wintry air, played amid the sportive snowflakes and carried upon the laughing wind.

The tall, young man, stepping from the north-bound train, felt the subtle power, resented its influence, but yielded to its drawing influence, his hat down over his eyes and buttoned up his great coat.

The snow was falling in clouds. The pavement was icy. The old familiar streets drew him on unwillingly.

Now he was near the old house—he had said he would not come back. He had vowed he would not, yet here he was. As he leaned on the hedge, his father's stern rebuke, reproaches and warnings came upon him again. And his mother's tears!

He turned to leave the spot, for how could he face them again? But softly, other memories clustered round him and he turned to gaze at the great walls. The same feeling which had impelled him homeward made him now pass slowly through the archway and up the terraced walk. He was on the steps. Now he was at the door. Suddenly it opened wide and a little figure in white with long golden curls, stood looking at him gravelly.

"Come in," she said, sweetly. "I was waiting for you."

Certainly this must be the little babe whose wailing and fretting he had so resented formerly. Did five years make such a difference in all children?

"We were looking for you," repeated the little girl. "Come, I will take you up to your room."

He followed as in a daze. A maid flitted across the hall—no one else in sight. He entered his own room, arranged with such exquisite care. On a stand stood a vase of rare roses, filling the room with rich perfume. He sank down into an easy chair and looked around. Why had he left such a room and home?

Why? The dissolute years flung the echo back into his face and laughed at him out of the past—mocking him. He bowed his head in his hand. At his feet seemed to lie the broken, shattered fragments of what might have been an honorable, useful life. Thoughts upon thoughts ran riotously about him bringing other troubled thoughts along.

At last he raised his head and looked at the strangely quiet child before him.

"Did you know I was your brother?"

"Oh, yes. Mamma told me."

"Why did you look for me?"

"Because mamma said you would come, sure."

"Where is mother? Is she here?"

"Oh, no!" a shadowy look passing over her face. "She is away out on Rose Hill, and——"

"What!" cried the young man, springing from his chair and grasping the child. "What do you mean?"

There were tears now in the great child eyes. "There were lots of carriages and they took mamma in the prettiest of all."

"O, my God!" he cried, sinking again into the chair, while memory lashed and scourged him with her many thronged lashes. Where had he been—ah, where might he not have been and what not doing, as that stately procession wound up and over that dreaded hill?

He could not believe it! Had it been his father, whose locks were silvered—but his mother! so young she had seemed to him and to others, so straight and lithe a form and beautiful of face. And he had left her in tears because of his wayward conduct.

In all his thoughts of home he had not thought of death.

"Mamma said you would come at Christmas time. She told papa to have everything ready. So we were waiting."

And this was the power that had reached after him, wooing and drawing him away from sin, pleading with him to come home—the magic of mother-love.

* * * *

There were steps in the hall, a man's stern, rugged face chastened by a great sorrow; deepset eyes in whose soul depth lay the light of the victory of parental love over justice—a man who looked eagerly through the rooms as he entered, half hopeful, half doubting.

From out his wife's room came two—a child with lovely curls and thoughtful eyes, and a young man over whose face the light of a new, deep and holy purpose was stealing, driving weakness from its old haunts among his features.

"My son!" said the older man, and the tenderness in his voice wiped out all the wrongs of the past and bespoke hope for the future.

And the pictured face on the wall smiled upon them all, while the spirit of the Yuletide closed softly in around them, with its fragrance, its blessing and its messages of the One who brought to earth its "Peace and good will."—Julia Hughes Persing, Ceres, Cal.

Soaps are made mostly from soda lye, instead of potash, the soda soaps being hard and the potash soaps soft. soapsuds, therefore, contain but little, if any, potash, but serve to prevent insect attacks to a certain extent. Some plants, like celery and asparagus, seem to thrive when drenched occasionally with soapsuds, which is probably due to the fact that soda is beneficial to such crops.

The Personal Neatness Club

SOME are inquiring as to our Personal Neatness Club. And at the same time have sent some suggestions. New Years is coming and that is the time when the bad man resolves to do better and turn over a new leaf. It may be wise to discuss as to whether the girls may turn over a new leaf profitably.

If we could so live that the pages of our life would contain no blots, and always be fair and beautiful, it would be far nicer than this turning the new white leaf over occasionally.

But since the time of mistake in Eden, it seems that we are prone to make the blots for which we are always sorry. Then we wish to see the fair, white page of a new day or a new year when we can begin with renewed determination to keep it fair, that we may look at it with pride and pleasure as we turn it over.

While the length of time which New Year's resolutions hold is a standing joke, they are none the less beneficial to us all. Therefore, let us spend the first days of the New Year in looking in and finding out the blots of last year which next year we will try and keep from our pages. Then after New Years let us

"Look out, not in,
Lend a hand."

Be helpful.

Be clean in mind and body.

Be cheery.

Be kind, always.

Be conscientious.

Be loving.

Be frank, easy and cordial in manners. Do not fear to show you have a heart. Do not hesitate to say a kind word to this one or perform a trifling act of courtesy for that one. Give a cheery word to the aged one whose journey is almost over. Speak the timely word to the sad-faced man or woman whose loneliness your well-meant effort will cheer.

Do not be afraid to let the sunshine of your happy souls flow out. Greet all you meet with a smile.

* * *

We recently promised something more from Mrs. Sherman. The hints are not so much along the line of personal neatness, as household neatness, but the terms are synonymous.

Cleaning Silver.

Alcohol with alum will take many spots off the silver. When the chasing becomes dark pour out a little alcohol and dip the cleaning brush into it, then into the powdered alum and leave the alum on for a day. Olives being salty should not be served in silver dishes, as they may bring out spots then it will be necessary to send the silver to the jewelers to have removed.

Cleaning Porcelain.

Discolored and grimy porcelain bath tubs should not be scurbbed with sand soap as it will destroy the glass lux finish that is put over the porceain to protect it from absorbing stains. Gasoline, or better, napholine are perfect cleansers. The coffee cups often show a ring where the hot coffee has stained them; a little gasoline will remove most of this. It s not amiss once a year to treat the tains on the meat platters. By using a tub and putting the dishes into t out of doors there is no danger of xplosion, but do not risk handling asoline in the kitchen for this purose.—M. E. S.

M. H. comes with a few dress hints. She has been with us before. They are good and most welcome.

The Popular Fad.

Every woman with a dainty artistic taste now desires to have some of her own handiwork on her waists and lingerie, and it certainly seems as if many have this taste judging by the numerous kinds of embroidery now done on these garments.

They also embroider tray cloths and lunch sets in colors or with white embroidery threads as desired. The white is, of course, the more durable, as repeated launderings of the colored embroidered pieces will dim their luster, but it is only fair to say that with careful handling in the laundry the colors will remain "as good as new" for several seasons, and it cannot be denied that a touch of color is very effective on the lunch cloths.

The waists are generally embroidered on such delicate fabrics that they, too, require careful laundering in warm suds made of white soap with borax added to soften the water and make less rubbing necessary, as they should not be rubbed much in the washing nor wrung hard and the bluing should be stirred in with the hand, before putting the waists in, to avoid streaks. A good cold water starch to use to stiffen these embroidered pieces is mixed in the proportion of one tablespoonful of starch to a half pint of water, a little borax and four drops of turpentine, and if made of very sheer material and you only want a little stiffening, a little borax put in the last rinse water will make them plenty stiff enough without the starch. If your waists have lace edging on them, should be ironed before the rest of the waist and pulled out gently with the fingers, and all such articles should be ironed on the wrong side before they are quite dry.—M. H.

HOMELY HINTS.

Rust on Clothes.

It is said that rust spots are frequently traceable to the bluing used in washing. Prussian blue, which is sometimes used in their preparation, is a compound of iron, and in the presence of an alkali deposits a rust spot. You can test it by boiling a little of it in a vessel with soap, or, better still, with caustic potash. If iron separates, the compound is Prussian blue, and you will have to be careful in rinsing to get out all of the soap.

To Kill Ants.

Small black or red ants may be banished by a little attention. A sponge is one of the best things. Sprinkle it with dry, white sugar. The sponge must be slightly moist, so that the sugar will adhere. The ants will go into the cells of the sponge after the sugar in large numbers and can be destroyed in hot water and the sponge washed and sugared again and returned to the closet for more until all are caught.

Insect Stings.

The best remedy for the sting of insects is that which will instantly neutralize this aciduous poison deposited in the skin. This is either ammonia or borax. The solution of borax for insect bites is made thus: Dissolve one ounce of borax in one pint of water that has been boiled and allowed to cool. The bites are to be dabbed with the solution so long as there is any irritation. For bees' or wasps' stings, the borax solution may be made of twice the above strength. This solution should be kept as a household remedy in every farm house. In case neither borax nor ammonia is at hand, a little soft soap or ashes should be moistened and applied at once to the bite or sting.

* * *

The proper way to wash silver is in scalding hot suds in which nothing else has been washed. If the silver is much soiled, hold the forks, spoons, etc., by the handles and pour a stream of clean hot water over the soiled parts to free them; then put the silver into the clean suds; rub it well with a sponge fastened to a stick, drain it out, and without rinsing wipe it vigorously on a clean towel. It will shine as if highly polished. Once a week after the suds, drop the silver into a pan of hot water, pretty strong of ammonia; wash it well in this; wipe, and then rub with paper.

Wash tarnished silver in hot soapy water; rinse in clean water and dry with soft cloth. Polish with a little fine chalk or pulverized whiting, using chamois for a final polish. If very much engraved, use silver brush to remove any of the chalk or whiting.

Silver may be kept bright if placed in an airtight case, in which there is a good sized piece of camphor (about the size of a hickory nut). Another method is to first warm the silver and then paint it with a thin solution of collodion in alcohol, using a wide, soft brush. Both these methods will be found excellent. A good cleaning and polishing compound is made as follows: Ammonia, eight ounces; prepared chalk, one ounce; mix and keep corked. Apply with a soft cloth or chamois.

To clean water bottles and decanters, mix together half a gill of vinegar and a handful of salt. Shake well in the decanters to be cleaned, and no matter how discolored, this treatment has been tried and found successful.

Chemists claim that it takes more than twice as much sugar to sweeten preserves, sauces, etc., if put in when they begin to cook as it does to sweeten after the fruit is cooked. Aside from this fact, it should be remembered that fruit which has been allowed to boil after sugar has been added has a changed and inferior flavor.

GIRLS, BE GIRLS!

When a girl enters the business life she cuts off her chances for becoming a wife, and the business life itself unfits her for that position. Man looks upon the woman in business as his rival and when looking for a wife generally chooses from those trained in domestic and social life, and this will be more and more the case in the coming years. The business life makes the girl more self dependent and, while it may submit her to more tempations, it makes her stronger by overcoming, and she learns to be less trusting and less credulous than she who is unaccustomed to the world. But it does not tend to make her a contented, happy wife. She is apt to become restless under the confinement of the home life. Having been accustomed to earning her own money and spending it as she liked, she feels humiliated to have to be dependent upon some one else for every cent she needs, and her attitude towards her husband will not be such as to produce harmony and love. If her training has been such as to train her for business, her domestic training has necessarily been neglected. Several years ago, a woman whose daughter was then entering the business life, said to me: "It is not necessary to train daughters in domestic affairs. It will all come naturally when they come to it." But is that a fact? I think one can be trained away from anything, and housework does not come naturally to all girls, even after having been trained. The mother who has her daughter's welfare at heart will do as the old-fashioned mother did, train her in all the arts of housekeeping, and teach her that the highest position she can fill is that of the mistress of a happy and well-managed home.

LIVE STOCK WANTED.

WANTED—ONE HUNDRED TWENTY good young Jersey cows. None but Jerseys wanted.. Will accept single carload lots. Geo. A. Smith, Corcoran, Cal.

SEED CATALOGUE.

The Johnson & Musser Seed Co's. catalogue for 1908 is before us. It is with pleasure that we note a great improvement in its appearance. The Santa Claus melon on the front cover looks good enough to eat. We understand that this melon, though only last year introduced by Johnson & Musser, has made a signal hit on the eastern markets this fall and winter. The supply is not now equal to the demand, and we judge that Santa will not have enough of this unique fruit to go around. On the back cover is displayed three magnificent watermelons all of which have originated in Los Angeles county. From our own experience we know that they are as good as they look, and feel confident that all the world together cannot equal these triplets.

We are indeed, pleased that the above firm is in the field with so many new and good things.

One of the features that strikes the eye is the great variety of Casaba melons, three new additions have been added this year, the Genoa Casaba. the Golden Beauty and the improved Hybrid Casaba, seed of all of these, we are told is very limited, just about enough to get a good test from for the coming season. The improved hybrid is said to be very promising. The propagation will plant forty acres next year.

The Hybrid and the improved Casaba made such a distinct hit last season that they threaten to push all varieties of both cantaloupe and muskmelons out of the market except for the early part of the season.

Among the more prosaic plant foods, new and promising, we note the monstrous pole lima bean, it is so fruitful that a yield of four tons to the acre is considered a conservative estimate. The seed of this promising bean is so limited that a dozen seeds sell for twenty cents; everybody should give it a trial.

The Perfect Pepper recently introduced by this firm is now past the experimental stage and far outclasses all others. We are glad to see that the seed of this wholesome vegetable is now to be had at a comparatively low figure.

Among the good things being originated in Southern California we wish to mention the California Pearl cauliflower, Oregon evergreen sweetcorn, Anaheim Chili pepper, white Early Rose potatoes, Angelus Phillipino and Chilean watermelon, the Hybrid Casaba and Santa Claus watermelon.

"SURE HATCH" PRIZES.

The Sure Hatch Incubator Company announces a prize contest for the year 1908 which will far exceed in liberality all previous contests.

The company has divided the United States into six districts and increased the number of "hatching" prizes in each district to seven, making forty-two prizes, besides numerous cash prizes for the best photographs showing the "Sure Hatch" Incubator in operation.

The majority of the prizes are "Sure Hatch" Incubators, which are well worth striving for, as these incubators are famous the world over for their splendid hatching qualities.

The Sure Hatch Incubator Company is the largest incubator concern in the world, and sells its output direct from factory to user at the factory price, on unlimited trial.

Readers of this paper who are interested in raising poultry for profit should write to Sure Hatch Incubator Company, Box 150, Fremont, Neb., or Dept. 150, Indianapolis, Ind., for the "Prize Circular" and valuable book on Incubators and Poultry Profits, both of which are free, postpaid.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Jan. 1, 1908.

Butter.

The price of butter is now satisfactory to the producer, though manipulation of markets throws the greater part of the profit to the dealers working the market back and forth to suit his own convenience. Extra creamery has been advanced 2½ cents during the week. Other grades practically same as last week.

Creamery extra per roll	77½
Firsts	57½@60
Seconds	60
Dairy	45
Cooking	45@47

Rolled barley	1.75

A VALUABLE RANCH.

One of the signs of the times which is agreeable, is to see large financial institutions going out and buying acreage property. City property sometimes offers fine speculative opportunities, but ranch property is almost invariably a safe investment.

One such company, looking to ranch property, is the Southern California Trust Co. This concern has amongst other properties a fine ranch near Corona of over 300 acres, which 125 acres is alfalfa and which supports 115 fine dairy cows. This is called the Lugo herd and is in charge of Nelson Teeter. The greater number of the cows are registered Jerseys, with a Marigold bull at the head of the herd.

Mr. Geo. A. Otis, of Pomona, is manager of the ranch properties of this large concern.

FOR COLD ROOMS HARD TO HEAT.

The coming of the cold weather gives rise to the question of how best to heat those rooms and hallways of the house that seldom if ever warm up, no matter how big a fire there may be in the furnace or other heating apparatus.

The best way out of the difficulty is the use of auxiliary stoves—and of these it would be difficult indeed to find anything so handy and at the same time so clean and economical as the Perfection Oil Heater.

Another home comfort for the long winter evenings is the Rayo Lamp, which can be used in any room in the house—from parlor to bedroom. It has the latest improved burner, making it unusually safe and clean, and an ideal lamp for all 'round household use.

The Perfection Oil Heater and the Rayo lamp, combining as they do to make the house warm and cheerful, are valuable additions to any home, and no household should be without them. They are sold at a moderate price by dealers everywhere.

San Francisco Markets

SAN FRANCISCO, Jan. 1st, 1908.

Butter.

Butter has declined severely during the last week, and was during the earlier days very weak in tone. At this time while the quotation is lower the tone is stronger.

The current prices on dairy products in San Francisco are always from 2 to 3 cents higher than the rates given in the daily official list of the Wholesale Dairy Produce Exchange. The retail dealers in this city invariably pay an additional 2 cents per pound on butter and per dozen of eggs, and occasionally it is 3 cents. On cheese the increase is 1 cent per pound. By making these additions to the Dairy Exchange prices the producer in the country can always determine the actual prices ruling in this city. The quotations as prepared by the San Francisco Wholesale Dairy Exchange yesterday were as follows:

California extras per lb	.33
California firsts	.31
California seconds	.25
Eastern extras	.24½
Storage Cal ex	.24½

Cheese.

Hay.

Somers & Co. say:

"Arrivals of hay show a material diminution from those of last week, the total showing 2550 tons in comparison with 3360. Water arivals have been the lightest that we have experienced for some months and it is quite evident that holders of hay at bay landings believe that they are warranted in discontinusing shipments in anticipation of a renewed car scarcity later on. Car shipments have been lessened very largely as a matter of necessity for the accumulation of the previous two weeks has interfered scriously with the disposing of later arrivals. A marked dullness in trade is always experienced on the hay market during the holiday season, but as a general statement, very little complaint can be made at the present time concerning present conditions here. Prices are somewhat better than they were last week, and most handlers of hay look forward to a fairly satisfactory winter's market."

DUTY OF PLANTING FORESTS.

Every man who owns a small ranch should have a timber lot. Every man who owns a large farm should have a relatively larger tract in forest trees. And every man who owns land that is not especially useful for other purposes should make it into woods. To these ends, great and small, the government of the United States, through the forestry service, stands ready to co-operate.

Among the several admirable policies of the present administration for the conservation of the natural resources of the country, the most important, at least from the standpoint of succeeding generations, is the preservation and extension of forest area. At the present rate of devastation there would be comparatively little timber left in a quarter of a century. The country's future welfare is absolutely dependent on its forests, for without them and the protection they give to the soil and to rainfall, all the other resources of the people would have comparatively little value.

But aside from these general inducements to make wood lots and rear forests, it pays the individual. The cost of all kinds of wood, whether for furniture, implements, lumber, posts, ties or other purposes, must go on increasing so long as the visible supply of timber goes on decreasing. And by the time forests now planted would becomc serviceable their value for wood uses would be even greater than it would be now. Wood is always needed on the farm. If a farm is without it, trees should be planted at once, unmindful of the fact that it takes many years to raise a "crop." And especially such land as is not fit for cultivation should be set in trees. When it takes a long time to mature trees, it takes a few years for trees to become a valuable asset. This fact should be borne in mind by those who figure on the market value of their farms.

The planting and rearing of trees is a simple matter. The forestry service is willing and anxious to givc all the assistance in its power. It will even send experts to inspect the soil and suggest the best trees to be planted. It wll send them agin to note the progress of the planting and givc any information that may be needed as to the continuous care of the trees. In order to bring up the wooded arca of this country to where it should be, dependence cannot be put on either the Federal government or the States, for there is not enough government and State land to make sufficient areas or to distribute these areas properly. The proposition is up to the individual land owners.

POPULARITY OF THE EUCALYPTUS.

and the increasing cost of fuel has had a tendency to turn public attention to some source of relief from both these threatening evils. The eucalyptus in its many varieties, seems to offer the greatest hope, and as a result there is a very heavy planting of this species in the State at the present time. There are very many varieties of eucalyptus, some of them exceedingly ornamental and nearly all useful. Chief among them in California are the Red and Blue gums. These are very fast growing trees, start readily from seed, require little attention and soon give returns. They are both excellent for timber, and for fuel are second only to coal. Where windbreaks are necessary there is no better tree for the purpose, and they can be often topped and will furnish a supply of fuel. In the Southern States, as in California, where railroads are already feeling the shortage of timber, railroad companies are setting out large tracts of eucalyptus for a futurc supply of ties. Where they will grow, they are the best trees for forestry purposes, for shade, or windbreaks and for ornamental purposes, and are to be recommended to all who have land upon which they can be grown. All the eucalypts are very susceptible to frost and will not do in the Eastern States, but in any part of California outside of the mountain counties they will do well, and in this fact California has another great advantage.

LIGHT ON THE TELEPHONE QUESTION.

It is but a matter of a short time when the telephone will be in every farm house in the country, because farmers everywhere realize the great value of having one.

There are a number of different makes on the market and farmers are apt to be confused as to which particular make they should buy.

We have been particularly interested in one made by the Stromberg-Carlson Telephone Mfg. Co. of Rochester, N. Y. and Chicago, Ill.

This concern is one of the largest of its kind in the country, and for a number of years they have been making a specialty of telephones for the farmer.

The telephones they make justly deserve their great popularity, and any one thinking of installing a telephone can do no better than to get one of the Stromberg-Carlson Co.'s make. These telephones are reliable in all kinds of weather, and their uses are too numerous to mention here, but this company issued several neat books about telephones, telephone lines and equipments.

If you want to know more about telephones and if you want to learn how to organize a telephone system these books will help you very much. They are free if you mention this paper.

You and every other enterprising farmer who wants to be up-to-date in everything should send for these books at once.

ABC AN XYZ OF BEE CULTURE.

The A. J. Root Company published at Medina, O., by the authors. This is the well-known A B C of Bee Culture, which is so familiar to all beekeepers who keep bees by modern methods. The old work has been largely rewritten and added to until it is now a book of nearly 600 large pages. It still retains the great feature of the old work in being very practical and easily understood. It is so very popular that 115,000 copies have been printed and it continues to sell at a great rate. It is splendidly illustrated, and fully indexed to make it suit the busy man. It is well printed on smooth paper. Withal, it is thoroughly American from start to finish, and yet it sells well in foreign countries, showing that merit will win everywhere. No beekeeper can very well do without the A BC. Price (cloth) $1.50, postpaid.

HAVE IT CONTINUALLY.

Pasadena, Cal., Nov. 29th, 1907.

Tuttle's Elixir Co., Los Angeles, Cal.,

Gentlemen: I have used both your horse and family Elixir for the last fifteen years. Have it in my house and stable continually, and would not do without it. I consider it best of all I have ever used, for what it is claimed. Very truly yours, M. E. Wood.

TREES

Vines
Palms
Roses

Our twenty-five years experience back of our nursery business, our immense nurseries, situated in the most fertile and favorable section of California; our system of growing and caring for all our trees, and the superiority of the stocks from which we propagate are points you should consider when buying. These are some of the reasons why Roeding's True Trees are always the best. Never buy cheap trees for such purchases are usually a great loss rather than a saving. We grow our trees true to name and all are strong and healthy with well developed roots.

Our nurseries comprise over 1500 acres and we have the largest and best stock on the Coast; everything in the form of trees, citrus, deciduous, ornamental, as well as a very extensive stock of roses, palms, etc.

Every order is given the most careful consideration and shipments are made as instructed and when desired. Our methods of packing for shipment insure our trees against injury and they reach their destination in perfect condition.

Ask About Burbank's New Creations

We are the sole propagators and disseminators for all of Burbank's new creations, and now have a large stock of several of his wonderful productions ready for market. Of value to every planter.

Santa Rosa Plum **Rutland Plumcot** **Gaviota Plum**
Formosa Plum **Vesuvius Plum** **Royal and Paradox Walnuts**

We have published a beautifully illustrated booklet in colors, telling all about them, which we send for 10 cents to all who are interested. Write for it.

GRAPE VINES

We have all of the leading table and wine varieties, either on their own roots, or grafted on Phylloxera Resistent roots. We are the largest growers of vines and can furnish you with any quantity.

Roses

Our stock is the best we have ever grown, and can be supplied in either tree or bush form. All of our roses are field grown thus insuring plants of strong constitution and robust growth.

Franquette Walnuts

(Vrooman Strain)

Walnut orchards are very profitable, and California is destined to become a great nut producing State. Of the many kinds of walnuts there are none more advisable to plant than the Franquette (Vrooman Strain). We have several thousand fine grafted trees ready for planting. Also such varieties as Chaberte, Mayette, Parisienne and other French types grafted on California Black Walnut root, as well as the Plancentia Perfection, the popular variety in Southern California in trees grafted on California Black Walnut and on their own roots.

Write for Our Catalogue--Free

Our catalogue is the best book of its kind ever published on the Coast. It is fully illustrated and gives much valuable information. We mail it free to any one wishing it.

Citrus Trees

Our citrus nurseries are located at Exeter, in the great Thermal belt of Tulare county. Our citrus stock is grown in deep, black soil which develops trees with magnificent roots and fine thrifty tops. Oranges, limes, lemons, citron, etc.

Deciduous

There is not a desirable sort that will not be found in our stock, and with our careful handling and developing you may be sure our trees are the best you can secure.

Deciduous Fruits in Northern California

A Review of Deciduous Conditions in the North by John Isaac, Secretary to the State Commissioner of Horticulture. Greatest Industry of the State. Most Conditions Ideal

California is essentially a State of specialties, and we find different sections devoted to different fruits. Southern California, for inance, is known over the whole world for its trus products above all else, while Fresno is own for raisins, Santa Clara for prunes, etc. does not follow that other fruits than these will t do equally well in these sections, but it so ppens that they have got started in these speclities and continue along these lines. Citrus uits grow over the greater part of Northern Calrnia and, in many parts, do wonderfully well, t we regard the Northern section as rather the me of decidious fruits, for it is here that the eat deciduous fruit output of the State is proced, and from here that the great annual shipents of fresh and dried and canned fruits are ade to all parts of the world. But in the deuous fruit sections of the northern counties, we d specialties prevailing and different fruits are und in the different sections here. Sutter coun- is largely devoted to the peach, the cherry is und in its glory in Alameda and Santa Clara unties, the Tokay grape monopolizes the couny in southern Sacramento and northern San aquin counties. This segregation of the different fruits has come about largely from the exrience of early growers, who have demonrated that certain varieties are reliable and profble in certain sections. It must not be inferred m this that no other fruits than those which edominate are grown in the sections mentioned, t these are the favorites with the orchardists d seem to be the most certain money getters.

ght Thousand Cars.

The importance of our deciduous fruit industry ll be appreciated when we consider that of esh fruits alone, fruits for consumption on the bles of the East, we export annually nearly eight ousand car loads. In his report to the late uit Growers' Convention, Alden Anderson, esident of the California Fruit Distributors, ves the following figures of shipments made rough his agency during the past two seasons:

	1906	1907
erries....	150	98
ricots..	16	71
aches........	584	699
ums and prunes....	1220	1039

scellaneous......	22	18
apes......	2052	3460

**Shipment to December 20th.
*Shipment to December 29th.

eatest In State.

It will be noted that, in spite of the fact that e past season has been a very poor one, most of e early peaches having been a failure, the aprit crop being very light and cherries below avere, the shipments of fresh fruit have been heav- than in 1906. This has been due to the unusuy good prices received in the Eastern market, d indicates a smaller pack of canned and dried it than usual. When to the shipments of fresh its are added the canned and dried fruits, unes and raisins, and other forms in which deuous fruits are marketed, it will be understood t deciduous growing fruits is one of the greatt industries of the State and, added to the cit- output, brings more wealth into California n any other productive industry.

Peaches are grown very largely for canneries, the great bulk of the crop is annually divert- to these concerns. In the Sacramento valley very large areas are devoted to this fruit. The favorites are the Muir, a large perfect freestone and Phillips' Cling. After these come the Salway, Lovell and Early Crawford, all good peaches. The clings are the favorite for canning owing to their solid flesh, which retains its form in the cans. Clings also ship well as they stand up in shipping better than freestones and reach the market in better shape.

Ideal Conditions.

The foothill and higher valley lands of the Sacramento valley afford ideal conditions for the peach. It is a fruit that demands a loose, sandy, soil, well drained and warm. It will not give its best results on cold adobe land, and such soil should be avoided in the setting out of a peach orchard. A location with a south-western exposure is ideal for a peach orchard, for it is a fruit that delights in the genial rays of the warm afternoon sun. Unless the soil is very retentive of moisture and is naturally damp, it is absolutely necessary that water be had for irrigating in our climate where there is little if any rainfall during the growing period of the fruit.

Peaches at one time were considered as a never failing crop in California, and every year brought certain returns. But of late years there have been several seasons, if not of failure, at least of shortage in the yield. This has been ascribed in the peach growing sections to the fact that there have been late and heavy rains during the blooming time and that in consequence, the pollen has been washed from the bloom and imperfect pollenation has resulted, causing the imperfect setting of the fruit. This has been especially the case with the early varieties, which for the past two years have given very poor returns.

The Blight.

A most serious disease of the peach, too, has appeared during the past three years in the peach sections. This is the peach blight. There have been heavy losses sustained from this disease, although it is now pretty well known how to handle it. The peach blight is in no way similar. to the pear blight, which wrought such devastation in the State, being a fungus disease, and easily reached, while the pear blight is a bacterial disease, working in the sap-wood of the attacked tree and completely out of reach. The peach blight has been known in the State for the past quarter of a century, appearing with greater virulence in some seasons than in others, but it now appears to have got a permanent foothold in many of our best peach sections and for the past three years has greatly reduced the output of fruit therein. Being a fungus disease, it is easily handled if taken in the proper season and treated in the proper way. It has been demonstrated that the spores which germinate and start a new cycle of the disease are deposited on the twigs and branches of the affected tree during the summer months. These are dormant but ready to germinate so soon as moisture and warmth are applied. These conditions are furnished by our earliest rains, and as soon as these come the minute spores which are lodged on the trees send out fine rootlets and become permanently attached. They are now prepared for their destructive work, and as soon as the tree puts forth its new growth of foliage early in the spring they gradually spread over it, the blight is there for the season and all hope of profit from the season's crop is gone. Now, by spraying with the Bordeaux mixture early in the season, while the spores of the blight fungus are still dormant, these can be killed and, the germs being dead, there is no danger from the disease. If left, however, until the fine roots have penetrated the wood, it is almost impossible to kill them, and hence late spraying has proven worthless.

Cherries.

Cherries, as stated above, seem to attain their greatest perfection in Alameda and Santa Clara counties; at least, it is here that the bulk of the cherry crop of California is produced. It is not, however, confined to these sections, for cherries are grown all over California where the summer heat is not too great. Vacaville and Winters are celebrated for their early fruit and it is from here that the greater part of the early shipments of cherries are sent to market; these sections are followed closely by the Placer county orchards, the fruit from these places being all in the market before the crop of Alameda and Santa Clara is ready for picking. The fruit from the latter places is largely consumed by the canneries and furnishes the greater part of the cherry pack put up for shipment.

The cherry requires a somewhat similar soil to the peach, although it will do well on heavier soil than the peach will stand. A deep, sandy loam is ideal, and the cooler valleys, those along the coast, supply the best climate, although in the higher mountain valleys good returns are had from this fruit. The best soil for the cherry is a deep loam, naturally damp, not wet, with the moisture equally distributed, avoiding dry, sandy and gravelly soils.

The cherry is subject to very many pests and diseases, and one of the greatest pests is the gopher. For some reason young cherry wood has a great attraction to this troublesome rodent, and often the first indication given of its presence is the death of the tree. These pests work out of sight, and one night is sufficient for one of them to destroy a tree that has taken years to grow. No delay should be admitted in running down these pests as soon as there is any sign of them in the orchard.

The most serious disease to which the cherry is subject is gumming. In this the sap is forced through the bark and congeals on the surface in globules of varying size, sometimes forming round masses of considerable size. These should be removed, otherwise they are liable to induce decay of the bark and the wood beneath, and so prove injurious to the tree. Where gumming manifests itself, the best treatment, so far as known, is to cut away the outer bark with a sharp knife and cover the wound with a varnish of shellac and alcohol. It often occurs that gum will accumulate in the crotch formed by the junction of two limbs. In such a case it should be cleaned out, or it will form a receptacle for decaying organic matter, which will cause the tree to decay at the point of lodgment. One of the worst insect pests affecting the cherry is the cherry slug (Eriacampa cerasi,) which, by the way, is not a slug at all, but the larva of a small saw fly. This appears in large numbers frequently during the summer and eats away the fleshy parts of the leaves, often almost defoliating the tree. A spray of Paris green will destroy them, or a more simply remedy is fine road dust

Culture of the Walnut

Written especially for the California Cultivator.

BY J. B. NEFF, ANAHEIM.

The Farmers' Institute conductor for Southern California, J. B. Neff, is also a large walnut and alfalfa grower in Orange county. Mr. Neff has nearly 7 acres near Anaheim on which are some of the finest grafted softshells in the State. The cut on first page of this issue is one of Mr. Neff's seven-year-olds, which gives an idea of the thrifty care of his place. Mr. Neff is too busy a man to answer questions regarding walnuts by mail. He tells us that his mail calls for an immense number of mail answers and he simply cannot give the time to do this. Address queries to Cultivator.—Ed.

WHEN walnuts are spoken of in California, it is always understood that softshell walnuts are meant, and softshell walnuts are becoming known in the markets of the United States as "California walnuts." This being a mark of excellence everywhere.

California Walnuts.

These were formerly known as English walnuts, probably because of having been marketed by English merchants when all walnuts were imported, but likely originated in Persia or Asia Minor, though it has been found native over a wide area, including the mountains of Greece, of Armenia, of Afghanistan and the northwest Himalayas, and is also found in Japan. Walnuts from Persia were brought to Rome by merchants and from there distributed over Europe.

There are no records to show when the first walnuts were planted in California, but the best authorities say that it was about 1769 and that the planting was done by the Mission fathers. Very few trees were planted for nearly one hundred years after the first planting. About the year 1843 a few trees were planted at San Diego by J. J. Warner, and F. E. Kellogg, sr., planted a small orchard at Calistoga, in the upper part of Napa valley, in 1848. Mr. J. R. Congdon planted an orchard of hardshells at Capistrano in 1869. H. K. Snow and P. T. Adams planted the first walnut grove in the vicinity of Tustin and Santa Ana in 1879. These were hardshells and the planting was an orchard of eight acres, which was characterized as a rash adventure by the neighbors, but the soundness of their judgment is shown by the fact that the orchard is one of the best producers in the valley after more than one-third of a century has passed. A year later Snow and Adams heard of softshell walnuts grown by Joseph Sexton, of Santa Barbara, and got some nuts to plant in nursery. They planted their first softshell orchard in 1883.

The Soft Shell.

The softshell walnut originated in Santa Barbara county and first came into notice in 1880. It is supposed to have been the result of cross pollination between hardshell and papershell walnuts. Softshell walnuts soon became popular and have been planted exclusively for the past twenty years under the name of Santa Barbara Softshells.

Mostly In the South.

There are but few walnuts groves of commercial importance north of Santa Barbara county, though there are some small plantings through the Sacramento valley and several acres planted in the Santa Clara valley and in Sonoma county.

The walnuts trees of the northern part of the State are mostly of French varieties, and largely Franquette, as it has proven the most productive in that district, though not equally successful in the southern counties.

Grafts and Buds.

Large plantings of grafted and budded walnuts have been mad within the last ten years in th southern counties, and almost th entire planting of the northern cou ties are grafted trees. The varie mostly propagated in the south known as the Plancentia Perfectio and originated in the Placentia dis trict of Orange county about eigh teen years ago. This is a vigorou upright growing tree which produce large, smooth nuts that hull free and are well filled with white mea The stocks used for grafting an budding have been largely seedlin softshell in the south, while th used in the north has been most the native black walnut, and ver frequently these are not grafted un ten to fifteen years old.

And the Blight Came.

A blight of both nuts and the gree twigs began to attract attentio about eight years ago; the Departme of Agriculture at once instituted vestigations which were supplemen ed, and are now being carried on the University of California, b which have not as yet resulted any preventive of the disease that of commercial value.

It has been found that there ar trees which are resistant to th blight and which produce large cro under the same conditions that caus other trees adjoining them to lo the greater part of their crop.

Since this fact has become known a series of investigations have bee made with a view of getting a tre that will be resistant to a great de gree, and at the same time produ large crops of desirable walnut from which to propagate by graftin or budding. Several such trees hav been found and top grafting on ol trees will be done next spring on scale large enough to demonstrate practicability.

Fertilization an Advantage.

It has been determined that heav fertilization will produce large crops, even where blight is seriou and that by this means productio can be increased until the orcha may be gradually changed to th more resistant varieties, by t grafting or other means.

Walnut groves have not had th care that has been given to orange neither in selection of varieties no in culture and fertilization of th soil, and it is possible that the bligh may cause growers to use bett methods of culture, as well as sele tion of varieties, and in the e be the means of largely increasin the production and value of the wa nut groves.

We Can Afford Only the Best.

The largest annual production o walnuts was 8000 tons, but this ha fallen off considerably until now th production is from 6500 tons to 750 tons per year. The average produc tion per acre is about 800 pound but groves that are well cultivate and fertilized produce from 1500 t 2000 pounds per acre. Trees tha produce 200 pounds per year are no uncommon, so it can readily be see that if only the best trees are use in propagating, either by budding o grafting, the yield of walnut grove can be greatly increased withou much additional expense, and th profits will be correspondingly grea er.

The Future of the Fig

Written especially for the California Cultivator.

BY GEORGE C. ROEDING, FRESNO.

When the fig industry shall have become one of the greatest of our fruit industries, Geo. C. Roeding, of Fresno, will make good his predictions as to its possibilities, and he will have credit for being one of its chief promoters in its infancy. To him more than any other one, belongs the credit of securing that little helper—Blostophaga—which has made possible the true fig of commerce. Mr. Roeding not only worked hard on his trip to Asia Minor after this insect, but his energies since the return from that trip have been given to place the fig in the front rank of our fruits.—Ed.

THE success of an enterprise, whether it be fruit growing or anything else, is dependent entirely on the right start. Having decided to engage in a certain line of this work, there are several important points to be taken into consideration: soil, climatic conditions and marketing without too great an expense, are matters which should be carefully considered before engaging in the industry of growing fruit for profit. To live under "your own vine and fig tree" is an attractive phrase, and there is much in it which appeals to the man seeking an investment and a home. It is safe to say without much fear of contradiction, that no State in the Union enjoys such a diversity of climates, or opens such a wide avenue for investment, whether it be agriculture, viticulture or horticulture, as California.

The possibilities of this great State have not been half told, and even those of us who are enthusiastic about its vast resources have only a faint conception of what wonderful developments will be made in the business of fruit growing in California in the next fifty years. Young as we are in this line of work, we already stand at the head, and California methods of doing things are copied in all parts of the world. Many people coming to California expecting to engage in the fruit business have met with disappointment and returned to their homes in the East with hard luck stories of California. Their troubles are, in a measure, largely due to their expecting too much to begin with; and, secondly, (and this has often been the case) to listening to the advice of some over-solicitous friend who has land to sell, and has little regard for the future in store for the tenderfoot who bought it. There is just as much good land to be had in California today as twenty years ago, and it is safe to say there is more, for much of the land which was then thought to be worthless has been brought into the highest state of cultivation, as a result of the remarkable development made in our irrigating systems.

As has been previously stated, all varieties of fruits find congenial conditions in various sections of California on acount of the great diversity of climates. Prunes have found most favorable conditions in the Santa Clara Valley, and in some of the northern coast counties; raisins of the highest grade are grown around Fresno, and the name "Raisin Center" has become indelibly fixed on this prosperous city. It must not be inferred from the above remarks that these fruits and no others can be grown in the localities named, for that would be a mistake. Attention is merely called to these places to illustrate that from a commercial standpoint certain localities are better adapted than others to marketing a particular variety of fruit. Stress must be laid on the fact that the variety of fruit grown may have a decided influence in the ultimate success or failure of an industry. In nothing has this been so amply illustrated as in the fig business.

The Fig in America.

No fruit has appealed more to the grower than the fig. Easy of culture, adapting itself to such a variety of soils, combined with the fact that the expense of harvesting is very light as compared with many other varieties of fruits. But in spite of all this, the industry has languished. Naturally the great desire of horticulturists interested in figs is to produce a fruit equal in flavor to the far-famed Smyrna figs from Asia Minor.

The White Adriatic fig, a Dalmatian sort, was very extensively planted from 1884 to 1890 in all sections of California, and even in Arizona and Florida. When the trees came into bearing and the fruit was found to be inferior to the imported figs, no matter how processed, growers finally concluded that figs could not be grown here, conditions apparently not being favorable for their successful culture. Nevertheless a fair trade has been built up in Adriatic figs. The shipments are in the neighborhood of 2500 tons annually.

The Smyrna type of figs differs from all others, for unless the female flowers of this fig are fertilized by the pollen of the Caprifigs, the figs shrivel up and drop to the ground when one-third grown. In other varieties of fruits, in which the flowers are exposed, any ordinary insect can convey the pollen from the male to the female organ, but in the fig all the flowers are enclosed in a receptacle, and it is only through the agency of the little insect or wasp, Blastophaga grossorum, which makes its home in the Caprifig, that the pollination of the flowers of the edible figs can take place. The Caprifig trees produce a succession of crops during the season and for every crop of figs there is a new generation of insects. The last crop remains on the trees all winter, the wasp remaining during this period of inactivity in the larvae form. The Smyrna figs are in the receptive stage in June, and the little wasp forces its way through the almost closed orifice of the fig, in many cases breaking off its wings in its eagerness to make an entrance. It crawls around in the fig, passing over the numerous female flowers, trying to find a place to deposit its eggs. The flowers of this fig are so constructed that it can not do so. The insect, although prevented from carrying out its object, proves a benefit to mankind for every fig entered matures into a luscious fruit with fertile seeds. A few days after an insect has entered, the fig commences to develop and expand, assuming a bright, healthy and vigorous appearance, while the figs which the insect has not penetrated have a sickly, yellowish green color and soon drop to the ground. The insect, after performing its function, leave the fig and dies.

Ripening and Curing.

The Smyrna figs commence to ripen from the middle to the latter part of August, and continue until October 1.

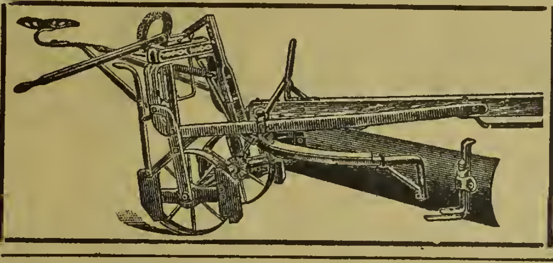
The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine strait ahead. The moldboard is six feet long. Has adjustable shoes shown at ends of moldboard to gage depth to which moldboard should cut. It's a very desirable machine for road-building in city of village. It makes good roads and keeps them so. Although made of steel and mallable iron, stlill it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front of wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, Ditching, Land Leveling, Foundation-digging,



For Irrigation, Canal Building Etc.

The price is lower than most such machines. We send it on free trial. Write us for our handsome booklet., "Delightful Roads." It's free and tells you all about the 20th Century.

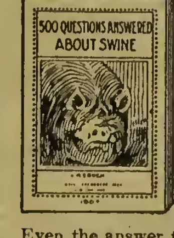
500 HOG QUESTIONS ANSWERED

A Copy of the Latest Authoritative Veterinary Swine Book. "Five Hundred Questions Answered ABOUT SWINE," Is Almost Certain Hog Insurance.



This latest Manual for Hog Breeders and Feeders, just published, actually contains answers to 526 live questions, which were really asked by Hog Breeders within the past five years.

The questions relate to Breeding, Mating, the Choice of Breeds' Feeding, Fattening, Management, Diseases, etc., of Swine. The questions and answers are carefully arranged and the complete index enables one to find at a glance the answer to the question he has in mind.

The Veterinary Department is so complete that a copy of this book in the hands of a breeder will pay for itself many times over in saving one pig.

INDISPENSABLE TO EVERY HOG RAISER.

The answers to questions on Feeding contain information which will put enough extra pounds on one pig to pay for a dozen books. Multiply this by the number of hogs you own and figure out what the book is worth to you.

Even the answer to just one of the 526 questions would cost you nearly 25 cents in time, letter writting, and postage stamps, besides the loss you might stand while waiting for the answer.

The information and answers are wholly dependable and come from the practical experience of the largest Swine Breeders and Feeders in the West and the most authoritative veterinarians.

THIS BOOK WILL BE SENT FREE ON REQUEST

To readers of the ***CULTIVATOR*** who send at the same time their subscription for the coming year. Good only to those paying in advance See particulars on Editorial Page under "Shop Talk."

The Ornamental Garden

THE AUSTRALIAN NUT.

THE Australian nut, Macadamia ternifolia, is cultivated somewhat in Southern California, and is a beautiful tree. It bears in about seven years from the seed and is worthy of more general planting.

A Cultivator correspondent, Mr. B. Harrison, of Barringbar, New South Wales writes us as follows: regarding this tree in its native haunts:

"This graceful, evergreen nut tree, which is not cultivated to the extent it should be, is found growing on rich alluvial and volcanic soils, bordering the rivers or creeks on the coast of Southern Queensland and the Northeastern portion of New South Wales. In its native or wild state it frequently attains the height of 50 feet, and it is of straggling growth. The trunk barely exceeds more than one foot in diameter. When the tree is cultivated, not only will the trunk be furnished with branches nearly to the ground, but it will form a beautiful unbrageous head. Its leaves are arranged in whorls of three or four, and are from five to two inches long, and bordered with sharp, thorny teeth, but sometimes they are entire.

"The small, white flowers are arranged in long racemes, and these are succeeded by nearly spherical fruit, varying slightly in size, but often about an inch in diameter. Each fruit contains one smooth, globular, or two half round nuts, which enclose a remarkably rich edible kernel of excellent flavor, resembling, but superior to, the filbert. The nuts are very hard, and it requires some force to break them. It is a very prolific bearing tree, and although I cannot state the yield, the number of nuts on the racemes vary from three to fourteen, and they keep well.

"They can be shipped in a good state of preservation to any part of the world. The tree requires about seven years to bear from seed, but the age varies in different situations. It seems to adapt itself to almost any kind of soil provided that it is not too stiff and is of good depth, and well drained.

"The cultivation of this fruit tree should prove a lucrative occupation to many land owners in California and the southern States, as there is an unlimited market for the disposal of the fruit, and there is not much competition. The largest area cultivated in Australia is only about one acre."—B. Harrison, Burringbar.

WILLOWS FOR BASKETS.

A truly infant industry in this country is the growing of basket willows. This is one kind of tree which can easily be grown in time to meet the demand. Osiers for making baskets have been heretofore all imported from Europe, but experiments by the Forest Service show that they can be successfully grown in this country as a farm crop. The manufacture of baskets is by no means so large as might be, and the increasing scarcity of wood for boxes may cause a greater demand hereafter for baskets.

A HINT ON EUCALYPTUS.

I would like to give the readers of your valuable paper a little hint on the culture of the eucalyptus, the tree that promises so much for the prosperity of California. I have adopted a new system of planting that is giving wonderful results in growth of trees with very little water.

The plan is as follows: Plow the ground soon as possible to give soil benefit of the winter rains, and just before planting plow again and in a manner that will provide a wide, open furrow for each row of trees. Now, stir the soil in bottom of this furrow with a sharp tooth cultivator. Follow this with the tree planting, and as the trees grow gradually work the earth to the trees. By midsummer have the ground made smooth and level.

This gives the tree a deep root system and makes the eucalyptus tree practically drouth-resisting. It also prevents trees from blowing over by high winds or being washed out by floods.—Geo. B. Southard, Redlands.

HOPE FOR THE PARCELS POST.

There has been a strong movement among our farm readers during the last two years for a parcels post. Postmaster-General Meyers has gone on record as announcing that he will advise the enactment of a parcels post law by the next Congress.

The establishment of a parcels post will greatly aid the farmers in sending and receiving small parcels through the mails. With our rural free delivery our parcels post will be a valuable acquisition to our postal regulations.

Of course the express companies to whom is paid outrageous tariffs on parcels will be expected to do all in their power to kill the bill. While these concerns have been successful in the past in preventing this much needed legislation the public sentiment in favor of parcels post has grown rapidly.

With the Postmaster-General favoring the measure it would seem as though the next Congress would pass a parcels post bill. Our lawmakers need urging in order that we may get needed legislation. Why not help in taking the initiative in this important matter that is of vital concern to the farmers?—Successful Farming.

A COMPLETE SPRAYING OUTFIT.

The Olds' Spraying Outfit is said to be a most complete and effective machine for ridding fruit trees of the pests of fungous diseases and insects.

No discovery in agriculture has proven so important and valuable to the farmer as the spraying of fruit trees, vegetables and nearly every sort of farm produce, to kill off bugs, worms and other pests and diseases injurious to their growth.

The effective Olds Outfit is handled by the Compressed Air Machinery Co., 34-40 Jessie street, San Francisco. The firm issues a bulletin regarding spraying, with spraying formula, and gives a list of the machines handled. It is of interest to orchardists.

Progressive grange at Healdsburg is increasing its membership, and showing every indication of a lively interest in matters of the farm. Last Saturday an all-day session was held, at which there was a harvest feast and degree work.

R. J. Hunter, of Colony No. 1, at Gridley brings in the measurement of a Himalaya Giant blackberry vine on his place which was set out last spring. At the base the vine measures nine inches in circumference.—Herald.

The Superlative Raspberry

Too much cannot be said in favor of the Superlative. It is a red, sweet berry three times as large as any other Raspberry, to my knowledge. It is a continuous cropper from May to November. I counted on one cane 472 berries of different sizes.

Just think of a sweet raspberry as large as a Red Logan. Do you know what that means? It means for years to come heavy demand for fruit and plants. Every nurseryman will want a big supply. It is a stiff, upright grower and it throws its young plants from the roots called suckers. The plants should be planted in rows 3 feet apart in the row, and the rows 5 feet apart. A good mulching in the spring will help them crop heavier all summer. Plants planted now will give you a nice lot of fruit this coming summer. In order to get the true Superlative I imported 10,000 plants from the producer. I warrant my stock to be true to name. See cut of berry in The California Cultivator, Dec. 5th.

Now is the time to plant. I warrant every thing I sell. Also guarantee safe arrival of plants, and if not satisfactory on arrival, return at my expense and money will be returned at once. Send for free Catalogue.

Developing a Higher Grade of Rhubarb

Mr. Wagner, of Pasadena, Still Working to Produce a Higher Grade of Rhubarb, While He Maintains That the Old "Crimson Winter" is Making Good Every Day

WHILE at the State Fair last fall the writer accidently ran on to a booth presided over by the genial J. B. Wagner, the Pasadena rhubarb specialist. That a pleasant half hour was spent in conversation with him goes without saying. Pleasant, because, first Mr. Wagner is one of those genial fellows whom it is a pleasure to meet under any circumstances; next because he is an enthusiast, and an enthuiast who is not a crank, has a fund of information, and usually a pleasing way of giving the information, which makes him a pleasing conversationalist.

Mr. Wagner's enthusiasm is largely centered upon rhubarb which, for seven years, has been a matter of great innterest to him in every way, and at every point, from the pollinizing, seed growing, plant production, field growing and even to cooking into sauce and making into pies. His first work was done from some of the choicest plants which he could secure from the originator, Mr. Luther Burbank, which was of such merit as to have commanded attention, particularly from all in the State of California, as well as in nearly all sections where gardening is engaged in. But in this State it has been so exceedingly successful that it not only attracted much attention, but has been planted by the hundreds of acres.

But not content with the great product which Mr. Burbank produced, Mr. Wagner at once took up the matter of improvement by hybridizing, and to that end secured some fifty other varieties from Australia and Asiatic countries. None of these fifty varieties were equal to the Crimson Winter, and were not expected to be by Mr. Wagner, but some of them had qualities which he wished incorporated with all the good qualities possessed by the Crimson Winter without losing any of the good qualities. How he did that is immaterial for the purposes for this article; suffice to say, that indefatigable work and patience succeeded, though to a certain extent we doubt not Mr. Wagner is not satisfied, or, rather, has not reached the perfection at which he has aimed. In fact, this he probably never will accomplish, for he is a man with high ideals and will always continue to perfect this favorite plant of his.

Making Good.

We recently had the pleasure of a short interview with Mr. Wagner in his beautiful home amongst his loved plants, and he favored us with some facts regarding the winter rhubarb. He said that first and foremost he wanted to impress upon the readers of the Cultivator that it has been conclusively proved that Crimson Winter Rhubarb is making good and will continue to do so. He meant by this, not only in regard to its high quality as a food, but because of the fact that the public are realizing this to an extent that they are paying high prices, and consequently it is a great success financially to everyone who has taken up its culture.

This assurance he has not only from the California standpoint, that is, the producers' and the California market men's claims, but because of an extended trip last summer covering much of the territory between the Pacific and the Atlantic, and the lakes and the gulf. On this trip he traveled over 12,000 miles and visited 33 different States and all the principal cities in the East. In each of these cities he went to the markets and secured all the information possible as to the demands of the markets for rhubarb. During July and August rhubarb usually sold at about 3½ cents per pound, while the out-of-season rhubarb, that is, that brought in earlier in the springtime, readily brought 13 to 16 cents per pound "The Eastern outlook is much better than ever before, as is evidenced by my visit in rhubarb growing sections of the New England States where they have hundreds of acres of rhubarb now growing where 15 years ago they only had small patches.

J. B. Wagner, Pasadena.

They have large hot houses, some of them covering half an acre, devoted to forcing during the winter months. For this forced hothouse stuff the growers receive from 35 to 70 cents per pound. This commands this enormous price because of its out-of-season possibilties, but the consuming trade complains somewhat because it is lacking in flavor due to the forcing process. I was told repeatedly that if California can produce this in the open the glasshouse grower will promptly be put out of business.

I was certainly very much surprised at the size of the stems of the Eastern grown rhubarb. They are not much larger, and in many instances are smaller than is our winter variety. And surely it is not so appetizing nor so attractive on the market.

I have had many people tell me that it grow much better and larger than here. This I believed until Mr. J. C. Vaughn, the Chicago and New York seedman, told me that it did fully as well here as in the East. As I say it had been my opinion that it could not do as well as in the East, partly because of my boyhood memories of the time when I lived there more than twenty-two years ago and the rhubarb which "mother used to cook." As to size, it was, indeed, surprising to me to learn that our California stalks were fully as large in diameter as those in our old garden."

Right here let us digress long enough to say that the reader will be able to see some exceedingly fine, large winter rhubarb, by calling at Mr. Wagner's place. It must be borne in mind that there is rhubarb and rhubarb, and those who do not appreciate between a fine article which has been grown from carefully selected seed and the ordinary scrub lots, will be truly surprised to see these magnificent stalks in Mr. Wagner's garden. Larger than a child's wrist, and sometimes two feet or more in length. When we remarked on the remarkable character of this product, Mr. Wagner said: "Now here, I am afraid that if you make an article of this and your readers see such a statement, they will say, without proper investigation, that it is a case of 'hot air.' and I wish you would ask that all who wish to verify these assertions to call on or write any of the following: A. O. Hayward, Thermal; D. E. Bryant, Pomona; Geo. Kopp, Burbank; C. R. Harrison, Norwalk; E. E. Isaac, Compton; G. E. Hollister, Chino; W. D. Maxwell, Downey." By the way, Mr. Maxwell was fortunate enough to put out some of this wonderful plant, and a few days ago he contracted with me for 20,000 more roots, and one of the above, Mr. Bryant, has eight acres planted and another ten acres ready to plant this season. He expects ultimately to have at least eighty acres planted to winter rhubarb. He is so enthusiastic that he would plant it all sooner, but of course is unable to secure plants for so large a tract within one season. Besides these there are two others who are desirous of negotiating for my entire lot of plants, but I have a pride in giving it the widest distribution, so that a much larger territory may be benefited by proving its worth.

"When I secured the original stock from Mr. Burbank seven years ago it was one round of queries as to how well it would do in this, or that, or the other section. This, of course, I could not at that time answer intelligently, so proceeded to give it a fair trail over as wide a territory as possible. Where I had no purchasers I distributed without price where people would agree to give it a fair trial and report to me. I am able in most cases to give authentic advice and opinion to those who may wish to know how well it will do in any section of Southern California, and also to many north of the Tehachepi. Anyone who will write to me and fully describe the soil, water, frost conditions, etc., I will be glad to answer from my observations as to whether success or failure will come from planting in the section described."

Going back to the Eastern market conditions, Mr. Wagner said: "One pecularity in marketing in the East is the fact that they tie in bunches leaving on the stem the entire leaf. This, of course, adds much weight and profit to the gardener. This, we could not do in California; that is, when shipping to the Eastern market, because the time in transit would cause decay in the leaf. Besides, I do not think it is right to ship and charge for something which is not all edible and adds nothing to the appearance of the article sold. This is especially true when such great profits as $400 to $800 per acre can be made, as has been done the first year with Crimson Winter Rhubarb."

* * *

When it gets right down to tacks in selling rhubarb plants we presume Mr. Wagner has sold more than all dealers in the State combined, and still has on hand a few more to sell. He told us recently that he has for the coming season over one-half million plants for delivery, on which he has worked studiously and intelligently, by hybridizing and by selection to produce a strain of plants which would be both high in quality and productive power. In this he has been aided by specialists of the Department of Agriculture at Washington, which has secured for him from foreign countries some varieties which it would have been impossible to have secured otherwise. One of these with medicinal qualities from Indo-China, Mr. Wagner thinks will become a factor in the agriculture in this section.

To the end that new interest may be created in rhubarb culture, Mr. Wagner has decided to offer prizes to be given at future State fairs as follows: For the finest exhibit, $50 worth of rhubarb plants. Second finest exhibit, $25 worth. Third, $10 worth, and to all others who make any kind of an exhibit, $2.50 worth of plants. This offer is open to anyone in the State, and is regardless as to where the plants on which the exhibit was grown were purchased. This shows that Mr. Wagner is not engaged so much in feathering his own nest as in pushing to the front this plant which has attracted so much attention the world over.

"You are wasting affection if you are pining for angels before you have learned to love folks."—Henry F. Cope.

Fruits in San Joaquin Valley

Written especially for the California Cultivator.

BY FRANK H. WILSON, FRESNO.

When in Dinuba a couple of years since the writer visited the home of Frank H. Wilson and was driven over much of the ranch. It showed that Mr. Wilson understands fruit growing and acts on his understanding, for his place had the trifty, well cared for, successful look which indicates the successful grower. A large part of the land was given over to the growth of nursery stock for the Fresno nurseries, of which Mr. Wilson is proprietor. In the following article Mr. Wilson is speaking from long experience.—Ed.

IN attempting to present to your many readers an article on the Deciduous Fruit Industry of the San Joaquin Valley, I fully appreciate the difficulties of furnishing an article which will cover accurately all the varied conditions of soil, climate, etc., which is found in this great valley. However, as a somewhat extensive grower of deciduous fruits, I shall endeavor to present my views as accurately as possible.

We have, I believe, in the San Joaquin Valley, especially in the irrigated sections, the greatest opportunities in diversified farming to be found in any portion of the United States, and possibly in the world. We have not, until recent years, appreciated these advantages, and while our range of products today covers nearly everything that can be grown in any semi-tropical country, our chief products are deciduous fruits and grapes. We have, however, only to look into the very near future to see the orange rank very close to our deciduous fruits in point of production. A most gratifying feature of our fruit culture is the high-class farming and care being taken with orchards and vineyards. Nowhere can be found more healthy trees and vines, as a whole, than in this valley today. To one who is acquainted with the early history of this industry here, the improvements over the old methods of farming seem almost phenomenal. The time was when everyone looked for quantity of fruit, not quality, but today we get not only quantity, but quality, unexcelled in any section of this great State, or the United States, for that matter.

Peaches.

Our climate here being dry and warm, makes it ideally suited for drying and curing fruits; consequently our settlers have planted varieties most suited to this particular branch of the industry. In peaches, the Muir, in my judgment, stands at the head of the list of freestone varieties; its great bearing qualities, ideal color, small and free pit, coupled with its freeness from "Curl Leaf" and other diseases, makes it the peer of all freestone varieties. A close second is the Lovell, similar to the Muir in size and color and, in addition, being a very good canner, as well as a first-class drying sort. It is, however, more susceptible to frost and "Curl Leaf" compared with the Muir. It ripens about a week later, making these two varieties a good combination to plant, as labor is an item to be considered in the busy drying season. The worth of other drying varieties of peaches I place in order, as follows: Elberta, Wheatland, Susquehanna, Late Crawford, Salway (a fine peach, but rather late for drying purposes), Early Crawford and Foster. The latter variety finds a ready sale as an early canner as well as an early dryer, and the Salway as later canner and dryer. Both are much sought after and highly esteemed for this purpose. While the early planting of peaches has been largely confined to freestone varieties, in recent years a heavy acreage has been set to clings. The superior quality of our cling peaches, coupled with the growing market for this fruit, has stimulated the planting of canning varieties.

It is no uncommon thing to find growers who have contracted their entire crops for a period of ten years to the canneries, at a price which leaves the grower a handsome margin of profit. In this list I place at the head the "Phillips' Cling," a peach which is yellow to the pit, medium size, fine texture, heavy bearer and an excellent keeper. This peach should be planted only on good soil and where late water is available for irrigating it. The next in point of value, I consider the Tuscan cling, which ripens with the Foster, and, like the Phillips cling, should only be planted in strong soil and where water is at hand for irrigation. In my experience I find it necessary to irrigate freely in order to bring these varieties to the required caliper. The Sellers Orange cling I consider next in value. This peach, under any ordinary condition, will attain sufficient size and consequently can be planted on somewhat weaker soil. It is a very popular variety and much sought after by canners. The McKevitt's cling is also a valuable sort and, I believe, the best white cling peach grown in this valley. It is uniformly large, fine texture, and always commands a ready sale for canning purposes. There are many other varieties which have been planted to a greater or less extent, but the above are the most sought after and the varieties which command the highest prices as commercial canning sorts.

Apricots.

The apricot has not been planted here as extensively as in some other sections of the State, and in many localities in the valley it has proved profitable and borne heavily, yet, on the whole, I do not consider it a regular cropper. The Royal and Blenheim have proved, under average conditions, the best fruiters, and while they are a little under size, the color is all that can be desired, pit readily, dry heavy, and are always in demand at the cannery. Other varieties which have a good record are the Routiers' Peach, Hemskirke, Large Early Montgament and Tilton Seedling. The latter has not been extensively planted and its merit has not been fully determined.

Plums.

Of recent years the plum has come into prominence as a paying fruit; more particularly as a green fruit shipper. It would be difficult to select from the long list of plums grown in this valley, the most profitable. All good shipping varieties have been money makers. On the river bottom lands the Tragedy and Sugar, also Hungarian (all of which are known to the trade as plums), seem to have the preference over other varieties.

On the uplands the Hungarian, Wickson, Kelsey Japan and Climax are most in demand. I have fruited and shipped these later varieties for several years and the returns have been most gratifying. There are a number of other sorts of plums which are profitable to grow and find ready sale for canning; chiefly among these I might mention Green Gage, Yellow Egg, Jefferson, Damson and Satsuma.

While the San Joanquin Valley is not generally considered a prune producing section, I believe on our river bottom lands are to be found as productive and profitable prune orchards as in any section of California. Orchards, when planted on Myrobolan plum root, have proved vigorous and lasting. The uplands have not proved so well suited to this fruit and extensive planting, I think, should not be encouraged.

Much has been written of, and prominence given to the fig as grown in this valley. Suffice it to say that this is its natural home, "The fig producing section of California." With the introduction of the true Smyrna fig here, the industry should be materially stimulated and prove a source of great wealth to our people.

Used in Every Hamlet.

While the great development of this valley has been largely along the lines of tree fruits, it is but a secondary consideration to the great and growing grape industry. Today our raisins are being used in every hamlet and by almost every housewife in the United States. New markets are being established and trade opened in foreign countries, so that the extension of our markets is keeping pace with the increased acreage being planted. Perhaps no one thing has added more to the increased consumption than the improved methods of packing, a large percentage of our crop now being sold in the shape of seeded raisins, packed in attractive one-pound cartons. These goods need no recommendation but establish for themselves an almost unlimited market. The industry was never on a sounder basis than today. The varieties most suited for raisins are the Muscat, Thompson's Seedless, Sultana and Malaga; the Muscat taking preference over all others. It should be planted only on good, deep soil, to get the best results. The Malaga and Sultana will thrive where conditions are less favorable. The Thompson's Seedless, while a rank grower, requires rich, loamy soil for heavy fruitage.

Reputation Established.

Secondary to the raisin in point of productiveness, is the wine grape. The reputation of our sweet wines is well established. Within the San Joaquin Valley is produced today something over ten millions of gallons of sweet wine, besides about one million gallons of brandy, which finds ready sale both at home and abroad. The varieties most planted here and which have proved most profitable, are the Zinfandel, Mataro, Mission, Grenache, Carignan, Father Zagos, and Burger. There are many other varieties in vineyard, but from a productiveness and profitable standpoint these have the preference.

Table Grapes.

We now come to the last and not least of our grapes in point of profit per acre, "The Table Grape." Few farmers who have been so fortunate as to possess a good table grape vineyard know the lack of no luxury. The past season has been a record-breaker for the shipping grape. No one season has equaled it to my knowledge. From old vineyards profits have ranged from $200 to $500 per acre, as a rule, rather than an exception.

The Malaga, while a good raisin grape, has also proved the most profitable as a green fruit shipper. Our eastern friends are taking kindly to these grapes. The demand for good fruit is increasing each year. The Emperor as a late shipper is unexcelled and good vineyards planted to this variety have proven wonderfully profitable. The Tokay while not grown to any great extent in the San Joaquin Valley proper, in the upper portion of this great valley, is extensively planted around Lodi and Stockton, also Modesto , and has proved a money maker.

The Thompson Seedless has also been extensively shipped to Eastern markets the past season and sales of almost $3000 a car of twelve tons have been realized on this variety.

We cannot of course expect these phenomenal prices to continue permanently, but good fruit, well packed, I believe will always bring the grower good returns.

The Only Kind Which Pays.

In order to maintain a good market for our products, no inferior fruit should be shipped. Our wineries will always take the poorer grades of fruit and that is the place to sell them.

Plant your vineyards on the best of soil, take first class care of it, and when in bearing, select a brand for your high grade fruit, packing nothing but the best under this brand and continue to do so and you will find the markets of the East will take your pack at good prices. It takes high class farming to produce high class fruit, and no other kind pays.

"Looks Good."

In conclusion I would say, the resources of this valley are unbounded. The soil is the most productive and water for irrigation the cheapest of any in any portion of California. The future looks bright indeed for the deciduous fruit industry in the San Joaquin Valley.

YUCAIPA VALLEY COLONY

Adjoining Redlands, the "Gem Home City" of California, the richest Citrus City

Fourteen thousand acres of rich, deep, sandy loam, where the annual rainfall for forty years has been 22 1-2 inches, and a failure of crops unrecorded. Without irrigation record crops of all farm and garden products have been produced regularly. Artesian wells have never failed and the many springs flow constantly.

Apples, peaches, cherries, apricots, figs, olives, plums, prunes, grapes, all deciduous fruits here find their natural home and produce the rich, solid fruit, which makes the valley famous.

Climate perfection with pure, dry air, temperature ranging from 90 degrees to 30 degrees.

Yucaipa City, the valley's business center, will be opened soon and developed into a clean, thriving community.

Electric transportation will bring the valley within a half hour of Redlands and three hours of Los Angeles.

In opening this property for colonization in tracts of twenty acres and upward, we propose, for a limited time, to assist those who secure homes there, to the extent of the cost of their transportation to California. Maps and descriptive matter will be mailed upon application.

Raisin Grapes

Written for the State Fruit Growers' Convention.

BY MRS. MINNA E. SHERMAN.

All readers of the Cultivator know Mrs. Sherman as having a fund of information regarding the dairy. But we give now an article which shows that her experience with grapes has fitted her to give of her knowledge in a way to inspire better care of our vineyards.—Ed.

THE earliest of historical people had raisins, dates and figs for food. Man's inventive genius was not taxed by having to cure these fruits, for in a dry, warm climate they dried on the vines and trees. The simplicity of the foods of the ancients suggests the Garden of Eden where food was the product of plant life, secured to man without toil.

In California twenty years ago we had nearly perfect conditions. Then there was no codlin moth, no phylloxera, no pear blight or white fly and no petty thieves. The rich people kindly took themselves off to New York or Paris for their foolish display. We lived the simple life, for none were over-rich and none in dire poverty.

Finally We "Caught 'Em."

Childlike we babbled of our blessedness! Then came codlin moth and pear blight! One-lungers and remittance men followed, then tourists and Paris fashions! These things we have assimilated. All the undesirable races of humanity have found a resting place in our earthly Paradise and when we dare to object the whole United States is shocked at a lot of talk, until it fears a further attack of gastritis and we are silenced. The workers for social betterment are appalled at the increased number of men that, with opportunity to earn money, refuse to work. They loaf, living on the earnings of their wives. Thank God! we have no longer to add "and of their children." These helpless ones are released, by the strong hand of law, from the weary hours that make a day's work in the canneries and packing-houses.

We're First.

The first raisins made in the United States came from California. To whom the credit is due I do not know. I am not here to throw that apple of discord in our midst. They were made, and that is enough, in the '70's; along in the '80's they became a commercial success. The peculiar suitability of Fresno soil, the abundant water supply, the long drying season, free from dew and fog, soon singled out Fresno county as the raisin center of the State.

The details of planting and laying out of a vineyard will be passed over, as time is limited. The choice soil for raisin grape culture is of small area even in Fresno county's vast domain. The deltas of the many wet-weather streams that rush down from the Sierras and sank away into nothingness on the sandy plain, carried the rich, fine, red soil to make the red raisin land. This heavier soil is a little later, about ten days, in maturing the grapes, but it makes the rich, meaty raisin—one that is a mass of tender jelly inclosed in a thin skin.

On the heavy red soils the vines reach maturity earlier and make larger vines than on less favored soils. The often-told story of paying crops of raisins on three-year-old vineyards is true of this soil. I have had three-quarters of a ton of raisins to the acre on a three-year-old vineyard. To secure this result the curing and cultivating season must be ideal in their way. The vines as ordinarily planted are picked up at random, often made from cuttings taken from a brush pile. This is not the way to make a first-class vineyard. A vineyard is well made when the cuttings are first selected from marked vines, then rooted; and, again, only the best of these rootings are planted. There is no more royal road to vineyard than to any other kind of goodness; it is ever the narrow, straight path of daily doing each day's work well.

Came from Europe.

The varieties of grapes used for raisin making are of European origin. The Muscat de Corde Blanco, the Muscatelle of Alexandria—both names are used for a white grape in Fresno county that is too nearly alike to have different names. It is a large, light yellowish green grape with a distinct flavor, of thin skin and very sweet. A good table grape, as the berries are large-sized. It has a fair number of seeds that are closely held in the pulp. The Sultana and the Sultanina are small, light yellow-green grapes that grow in large bunches and are entirely seedless. A few Fehre Zagos and Malagas are dried each year, also, for raisins. Under proper conditions the Muscat is a vigorous grower, but it has little ability to withstand adverse conditions. When it is starved it takes to making small two-crown and seedless berries. When this occurs it is time to lengthen the pruning and put on some fertilizer. The Muscat has been pruned short, very short, to force it into producing crown cluster of large berries. The demand for the Dehesa cluster has grown less each year. Fresh fruit is plentiful all winter in the large cities and raisins are no longer a necessary part of the dessert. Today, quantity rather than quality, is in demand in raisins, the pruning has been lengthened. Three, four and five buds are left on the spurs, where a few years age two would have been considered as enough.

The Muscat is pruned to low stumps. It was strongly brought to me how forlorn they look after pruning time, by a woman on the train saying to me: "I thought this country had grape vines?" I said: "Yes, there is a vineyard. "Oh!" she replied, "I thought that was newly cleared land covered with stumps."

Certainly, it requires an eye of faith to see those stumps become a vineyard in a few short months, full of beauty. Nature, however, even in the winter time paints the red-brown soil and surrounds the blackened stumps with the gorgeousness of the poppies. They fill everything with the sunshine of their fragile beauty.

Some Things Worry Us.

Frost and defective pruning produces "nigger heads" in a Muscat vineyard. These round black masses with a fringe of new canes around their base are indication of a failing vineyard. The remedy now applied is to raise as many of these canes as possible to the crown of the vine, tie them together and cut them across to make a new crown over the old one.

Midway between Compton and Long Beach, on the Pacific Electric Ry

This is one of the finest Dairy Herds in the State. Cows are all selected Dairy Stock, including 30 2-year-old Heifers and 10 Calves.

Also 2 span fine, large mules; 1 span matched light driving mares, 1 saddle mare, 1 standard-bred brood mare in foal to Zoloc, 2:05¼; 1 3-year-old mare in foal to Zoloc, this mare has stepped a mile in 2:21 after 6 weeks work; 1 2-year-old filly, record mile in 2:30, entered in $10,000 stakes for this season; 1 yearling filly unbroken, also entered and paid up in $15,000 stakes for next season.

Also FARMING IMPLEMENTS, including farm wagons, plows, discs, reapers, milk wagons, buggies, etc., etc.

The Owners Invite Inspection Before the Sale.

TERMS: Six months' time on approved note. Liberal discount for cash.

FREE LUNCH.

Take San Pedro Electric Car at Sixth and Main streets, get off at Watson station on the ranch. Cars leave depot at 7:35, 8:45, 9:55, 10:55, 11:55 a. m.

C. BROWN, PROP. J. H. TORREY, MGR.

220 DAIRY COWS and HEIFERS

McFadden Ranch, January 24, '08 at 10 A. M. Prompt

Two Miles South of Santa Ana

This is without question one of the finest herds of DAIRY COWS in Southern California. Cows are all bred from thoroughbred stock and consist of selected Holsteins, Jerseys and Durhams.

Also two thoroughbred bulls, one registered; Lawrence Burrell Kennedy Milking Machine, six machines; gasoline engine, separator, electric motor, churn, pulleys, etc.

Owner Invites Inspection Before the Sale.

TERMS: Six months' time on approved note. 5 per cent discount for cash.

FREE LUNCH.

Take Pacific Electric Cars at Sixth and Main streets, for Santa Ana. Carriages will meet all electric cars.

JAMES McFADDEN, OWNER

As soon as these spurs are stiff enough to be self-supporting, the cord is removed. The next year's pruning uses these spurs as old wood are pruned, leaving two or three buds on each cane coming from them. Old vineyards that had dropped in production until unprofitable, after three years of long pruning, have come into full bearing again. What the ultimate result will be we cannot forsee, but it is certain that old blasé vines have been restored to youthful verdancy. Spring frosts are one of the troubles that makes the morning naps of the rasin grower far from peaceful. These are mean little nips that kill back the early leaf growth and take the tiny new-born bunches. The baby bunches of grapes are folded away with the tiny leaves and tendrils in the bud, by the mother vine for next year's unfolding. While it is known that the crop is often greatly shortened by this nipping, little has been done to prevent its ravages. It does not come often enough to be a serious menace, fortunately. We have tried brush burning, fire pots, and all the rest of that smoke-forming cloud protection. It was lots of fun for the boys to get up at three in the morning, have hot coffee out in the vineyard, and then have half a day off to sleep. The smoke would never obligingly form a cloud, it sailed straight up, and up, and up out of sight.

Water on the land will lessen frost; in a large way this is true, now the skilled vineyardist tries to have the small irrigation ditches full of water during early spring time.

It is also a matter of observation that the heaviest frost we ever had, the coldness flowed like water, so that a fence or a row of trees turns a side flow and in many cases that portion of a vineyard was saved. These hours of coldness come at about three in the morning and pass with sunrise, so that a few hours at most is only needing guarding.

From Waking to Sleeping.

The vineyard in the springtime rapidly takes on beauty. The tiny green woolly leaves put out on the brown lifeless looking trunk and touch the heart with their tender baby-like helplessness. Quickly they grow and soon the leaves take on a shining surface, like the schoolboy's happy face. Then comes youth and the clinging tendrils of love outreaching until they clasp hands across the rows with another outstretched hand. Middle life, the long, hot summer day, is the period of fruitage and of silent work. Autumn, like old age, has the perfect grapes, the wine of character tried is ready for the gathering. The leaves as earthly dross silently fall one by one, returning back to earth. The vintage is here and the vine sinks into the silent sleep awaiting the resurrection of spring.

Some Cultural Points.

Good plowing and plenty of it, varying the depth year by year so that the plow sole is controlled, then cultivating to retain the moisture. The old story of increasing fruitfulness of the vineyard in which the old father told his son he had buried a treasure is applicable to California. The land needs working. Try it this season for yourself, water a ten-acre piece vineyard, then divide it into four equal parts. Plow the first quarter as usual, the next quarter give one extra plowing, the third quarter two extra plowings, the fourth quarter three extra plowings, double the cultivating and harrowing in the same proportion. The result will not only show the first year, but will continue to show for a term of years.

The chief defects in Muscat grapes is weak pollinization or dropping of the berries at blossoming time. The Muscat does best when it is planted by the side of grape of other varieties. It is a good plan to plant the long way of the vineyard every other check with a good vine for pollen. The wine grapes have many varieties

California Fruit Growers' Exchange

The Most Successful Cooperative Fruit Marketing Organization in the World. During the Last Three Years It Has Marketed 43,320 Cars of Citrus Fruits, for Which a Net of $29,329,212.21 Was Received, and Out of That Vast Sum, the "Bad Account" Loss Was Only $310.00

Shipped Last Year 55 Percent of Crop

COOPERATION and organization have been the means of bringing to success many issues and this holds true of the association known as the California Fruit Growers' Exchange, which, as its name implies, is an association formed for the purpose of handling to the best possible advantage, and finding markets for the thousands of carloads of citrus and other fruits raised so extensively in California, and which are so much sought for in the best markets of the world.

The first attempt at an organization of this kind was made at a convention of growers at the Chamber of Commerce in this city in April, 1893. the declaration of principles of the association then formed being as follows: "To provide for the marketing of all the citrus fruits at the lowest possible cost under uniform methods, and in a manner to secure to each grower a certain marketing of his fruit and the full average price to be obtained in the market for the entire season."

The organization of association and district exchanges, following the recommendation of this convention, was effected in all the principal citrus fruit-producing districts, the packing to be done by the association at cost, and the marketing through an executive committee composed of one member from each district. Under this arrangement the marketing of fruit was continued only during the seasons of 1893-94 and 1894-95, but, proving unsatisfactory, the organization of the Southern California Fruit Exchange was consummated in October, 1895. This organization was in turn was succeeded by the California Fruit Growers' Exchange to admit of allowing the fruit of the entire State to be handled by the association. By virtue of this change and the expansion of its powers and efforts, the exchange in the last year has handled 16,217 carloads of citrus fruits from all sections of the State, of which 2523 were lemons, which, after deducting charges for freight and cost of selling, brought a net return to the growers of $12,250,000. As a sample of the immense business transacted by the exchange it may be said that 70 per cent. of all the lemons raised in the United States is handled by it, to say nothing of the great bulk of the oranges grown in this country.

The foundation of the Exchange was laid upon the theory that every member is entitled to furnish his pro rata of the fruit for shipment through his associations, and every association its pro rata to the various markets of the country, thus giving to every grower his fair share and the average prices of all markets throughout the season.

It is also a provision of the plan that all fruit shall be marketed on a level basis of actual cost, with all books and accounts open to inspection by the members at all times, a feature of fairness in cooperation that is commendable. Salaried and experienced agents are maintained at all the principal markets in the United States and Europe, who sell direct to the jobber, thus saving to the grower the profit that otherwise would go to the middleman. Not only is this saving great in itself, but it is largely added to by the fact that, through this community of interests and cooperation, the growers are getting their packing, handling, supplies, shipping and collections expeditiously done and at much less cost than by the old-time methods of individual handling and sale.

One of the most important features of this cooperative plan is in the matter of supplies, by which many hundreds of thousands of dollars have been saved within the past three years. Where the individual would not be able to secure advantages were he forced into the market alone, purchases are made in large lots and by contract, and the advantages have been so apparent that the growers have organized for the manufacture of their own boxes, and by next year these will be made in large quantities at greatly reduced cost, all of which means larger returns in net earnings from the citrus acreage and more money to the credit of the growers in the banks throughout the State.

An air of simplicity marks the working basis of the organization. After the growers have assembled and organized, each locality of a district maintains a separate association, sending a representative to the district exchange, which acts in the capacity of a clearinghouse for that section. A member is sent from this district exchange to act as a director of the California Fruit Growers' Exchange in this city. The growers thus, through a well-defined channel, govern themselves and have complete supervision of the entire organization.

The district exchanges are as follows:

A. C. G. Fruit Exchange	Azusa
Arlington Heights Fruit Exchange	Riverside
Covina Fruit Exchange	Covina
Duarte-Monrovia Fruit Exchange	Duarte
Ontario-Cucamonga Fruit Exchange	Upland
Queen Colony Fruit Exchange	Corona
Redlands-Highlands Fruit Exchange	Redlands
Riverside Fruit Exchange	Riverside
San Antonio Fruit Exchange	Pomona
San Bernardino County Fruit Exchange	San Bernardino
Semi-Tropic Fruit Exchange	Los Angeles
Sunset Fruit Exchange	Orange
Tulare County Citrus Fruit Exchange	Porterville

It is the duty of the "home," or local, associations to attend to the packing, and everything is done at actual cost, the shipping being through the district exchange. The sales are made by the California Fruit Growers' Exchange. At the first of each year the total cost is computed, and this being deducted from the returns, the remainder, which is the net profit, less the cost of the growing and picking, goes to the manager of the orchard in which the fruit was produced, and at the close of the season the exact cost is determined and the balance remitted to the grower, who thus pays only the exact cost of handling his fruit. At the present time the total cost of packing, shipping and marketing will average about 35 cents per box, while 75 cents was considered a fairly low figure per box previous to the perfecting of this organization, and in fact frequently exceeded that figure. Also before organization the charges of the commission men for disposing of the fruit alone were higher than the entire cost of the former charges.

The California Fruit Growers' Association occupies general headquarters on the eighth floor of the H. W. Hellman building, the roster of officers being as follows:

F. Q. Story, president; P. J. Dreher, first vice-president; W. G. Fraser, second vice-president; B. A. Woodford, secretary and general manager; E. G. Dezell, assistant general manager; J. L. Merrill, cashier; R. H. Wilkinson and R. P. Burton, sales managers; A. D. Fraser, claim-manager.

The best executive ability and keenest financial thought mark the entire handling of the affairs of the exchange, its high character of procedure having won for it the utmost respect in the markets of both Europe and America. While imbued with the importance of their work and at all times conducting the affairs of the exchange on strict business principles, there is a decided air of courtesy and approachability in the officials and management, and this in great part is the secret of the success of the exchange.

While not attempting to specialize it may be remarked of the president, F. Q. Story, that he is in the front rank as one of the captains of industry who has given fame and credit to California and its extensive fruit interests. All the officers are men of more or less practical experience in the matters of which they are in charge, notably the secretary and general manager, B. A. Woodford, who is a grower himself, having gained much practical knowledge from personal experience in the growing, shipping and selling of fruit. The record of the sales-manager, R. H. Wilkinson, has amply proven his fitness for the position which he holds, while his assistant, R. P. Burton, has evinced a decided success along the same lines.

Before the establishment of exchanges and the strength and utility and cooperation in disposing of California fruits was shown, it was the custom of the commission men in the various markets to give attention to citrus fruits only at such times as these fruits dominated the market or were in excellent and immediate demand, and the grower who failed to strike the propitious moment with his crop went begging. He had no alternative, if his fruit didn't rot, but to pay exorbitant commission rates, because the agents could make more and quicker profits in some other lines.' But time and the exchange have worked decided wonders. Now, through the exchange, the commission men in the markets of the world clamor for and are eager to handle the California fruits.

Some idea of the growth of the industry during the past three seasons may be gleaned from the fact that in 1904-5 14,219 cars were shipped at a net price of $7,123,962.54, with a loss of $310. In 1905-6 12,384 cars were marketed; net amount received, $9,936,497.67. The crop of 1906-7 consisted of 16,217 cars marketed at an estimated net amount of $12,268,752, with no loss reported.

It may be pointed out that the management of the exchange made a remarkable record in the three past seasons referred to, as it will be seen that while a total of 43,320 cars were marketed, representing a net amount received of $29,329,212.21, yet there had been a total loss of but $310 in loss through failure to collect, or loss in transmission of funds.

There are over eighty associations, covering every citrus fruit district in the State, and packing nearly two hundred different reliable brands, yet every exchange has its own private brand and makes such rules for grading, packing and pooling the fruit as may be agreed upon.

Local exchanges are formed from the several associations in a locality, and serve as a medium between the associations and the general exchange.

The directors of the California Fruit Growers' Exchange comprise the thirteen stockholders, all of whom are selected by the local exchanges.

Possibilities of Nut Growing

Written for the State Fruit Growers' Convention.
BY LEONARD COATES, MORGAN HILL.

The paper given below was written by Leonard Coates, of Morgan Hill, for
ıe State Fruit Growers' Convention recently held at Marysville. Mr. Coates is
nthusiastic in the belief that nut culture will be more of a factor in this State's
roducts some day. There have been many failures in nut culture, but study of
onditions and requirements may bring the success to other nuts which the Cali-
rnia walnut is now promising.—Ed.

NUT culture in California embraces only the almond and the walnut as established in-
stries of commercial importance,
itting the peanut as belonging
re to vegetable culture, and allud-
; to the pecan, filbert, chesnut and
tache as still in more or less of
experimental stage.

uoting from the chapter on the
lace of Nuts in the Diet," in the
rrent Year Book, Prof. Jaffa says:
has been shown by the numerous
estigations that nuts are rich in
tein and fat, and that these nu-
nts can be fairly well assim-
ed. Nuts being such a concen-
ted food, their proper place in the
t is a matter for more careful
sideration than is the case with
ny of our ordinary food mate-
s. It must not be forgotten that
ertain bulkness of the diet is con-
ive to its normal assimilation,
that too concentrated nutriment
often the cause of digestive dis-
bances. It might be expected,
n, that nuts could be most advan-
eously used in connection with
re bulky foods, such as fruits,
etables, breads, crackers, etc.
st rationally used, they should
stitute an integral part of the
u rather than supplement an al-
dy abundant meal. Since nuts
so concentrated, eating a consid-
ble quantity out of hand at odd
es will mean an over-supply of
if a corresponding reduction is
made in other foods.

he distress sometimes experi-
ed when nuts are eaten is, un-
btedly, often due to improper
tication or to over-indulgence.
investigations made at the Cali-
ia station indicate clearly that
siderable quantities of nuts prop-
eaten do not cause distress.
re is a popular belief that a lit-
salt with nuts prevents the di-
tive disturbance resulting from
ng them. To most persons salt
oubtedly adds to the palatability
the nuts, but no investigations
e been found on record which
onstrate any actual improvement
he digestibility of nuts due to
"

Almond.

he almond was the first of the
ts" to become of commercial im-
ance in California, and, owing to
atic conditions, this State will
ys enjoy a monopoly in its cul-
tion. Success, however, has
from the start rather uncer-
, although added experience and
cord of some partial and total
res may now be taken advan-
of, and mistakes, therefore,
ded by those who are engaging
he production of this crop. The
ier planted varieties consisted of
Langucdoc, imported from
nce, and the Tarragona from
in. These were not generally
itable, and the almond industry
uished until it received a fresh
tus on the introduction of the
h seedlings in 1885. Since then
r good seedlings have been
n so that, at this time, we have
tandard varieties, I. X. L., Non-
el, Ne plus ultra, Lewelling, Drake, Peerless and Texas (Texas Prolific.)

The almond has been an uncertain cropper owing to its early blooming, rendering it liable to injury during spring storms or frost, and to the more or less self-sterility of the blossoms of some varieties. To produce varieties by intelligent crossing, that are late bloomers and self-sterile as well of high quality, is what plant breeders should have in mind when experimenting with the almond. The Jordan has been planted rather extensively the last few years, some old trees of other varieties being grafted in order to hasten bearing. Samples of California-grown Jordan almonds are reported at Washington as inferior to the Spanish product in quality, and the suggestion is made that seedlings of the Jordan type may be raised in the State that more nearly meet the requirements of the market. I would recommend that Texas, Lewelling or Drake be planted alternate with the other named varieties to act for them as pollenizers. Just to what extent this will increase the chances of regular bearing is largely conjectural, but there is no doubt that an almond orchard should always be planted in this way.

A mistake has been made in the endeavor to produce almonds with abnormally thin shells, rather than having the quality of the kernel the main object. No good is gained when an almond or a walnut is produced having an excessively thin or paper shell, but the reverse. Rapid eating, causing indigestion, would be encouraged, and nuts with shells so easily broken would much more readily deteriorate and become rancid. The almond succeeds best on almond root, and requires a deep, warm soil, or a hill location where a shaly or rocky subsoil permits free access for the roots.

The Walnut.

California produces, at the present time, about twelve million (12,000,000,) pounds of walnuts annually, in comparison with which the production from other States is not worth mentioning. The Persian or so-called "English" walnut has been planted in several Eastern and Southern States for more than one hundred years, but it is still considered merely as a curiosity. Its non-adaptiveness in those regions is doubtless due to the great extremes in climate. The tree thrives and bears well in France, England and other European countries. In the former country selected seedlings have become fixed types for many years, and from these trees others are propagated by the ordinary processess of budding and grafting.

All trees and plants are amenable to climatic influences. Hence seedlings raised from trees which have been transplanted into a climate where the conditions are less favorable than those to which they have been accustomed, will have a tendency to become hardier than the parent. Plants adapt themselves or become acclimatized to a much greater extent than is generally believed. Take, for example, two species of eucalyptus, E. corynacalyx and E. rudis. Both have roundish leaves changiing slightly as they get older, but the former, being used to a cool climate carries its leaves horizontally, enjoying all the sunshine it can get; while E. Rudis, finding itself further in the interior under the rays of a hotter sun, swings its leaves over, hanging vertically, to escape injury therefrom and to retard evaporation.

So we find many seedlings of the walnuts first planted in California bearing good annual crops of first-class nuts, while the parent trees were very unsatisfactory. Some of these have long been recognized as varieties, such as Santa Barbara Papershell, Ford's Improved, Placentia Perfection and others, many thousands of trees having been grafted from the original ones but, unfortunately, many more thousand seedlings have been grown which has resulted in the production of a large percentage of second grade nuts.

As I have on other occasions stated, it is a grave mistake to imagine that these varieties do not succeed and bear well in almost any good fruit section in Northern as well as Southern California. The trees first planted more than a half a century ago in Sonoma and Napa counties never bore well, and it is claimed the trees were frequently diecious, neither is there any record of their success elsewhere, but only of some of their selected offspring.

Pecan.

The pecan has had no attention bestowed upon it of recent years. The late Dr. Strentzel planted a grove at Martinez, and isolated speciments are to be found in most of the older settled valleys of the State. The pecan is very often diecious, which accounts for single specimens frequently being barren. This is a reason why the pecan is often said "not to do well" in California.

While our summers are long, the usually cool nights retard growth, and in consequence, the nuts do not ripen near the coast. A rich soil, plenty of moisture, and a hot summer form a combination congenial to pecan culture. The river bottoms of the Sacramento-San Joaquin valleys form an ideal location for this tree. This is no theory, but a statement based on observation, for anyone may see the pecan flourishing and ripening good crops of excellent nuts from Oroville, Butte county, to Tulare and Kern. But, as with the walnut, it does not necessarily follow the varieties or fixed types, succeeding well in Texas or Florida, will do equaly well in California. The conditions being so different it is more than likely that what is best in Florida would be a partial failure here.

Therefore, we want to raise our own seedlings and, by selection, produce types worthy of varietal propagation.

I would strongly recommend that the pecan be planted extensively in the interior valley as a street and avenue tree, its symmetrical, upright growth being so much in its favor. A double purpose would then be served, as, in the course of time, varieties would thus be found suited to our climate and meeting the requirements of the market.

Chesnuts.

Chesnuts deserve more attention. The European varieties and those imported from Japan form highly ornamental trees and, with the ever-growing demand for nuts as food, they will have added value. The chesnut stands heat well, some of the largest in the State being in the Thermalito Colony near Oroville.

Filberts.

Filberts have not been much of a success thus far, though Mr. Felix Gillett reports them as bearing well at Nevada city. There is no doubt that the nut trees (excepting, of course, the almond,) while in some instances diecious, or bearing staminate and pistillate blossoms on different trees, more often suffer or fail to bear good crops through a lack of simultaneous blooming of the male and female blossoms.

Pistachio.

Pistachio, or green almonds, (Pistacia vera) has been grown to a limited extent in California for many years. G. P. Rixford of Sonoma was, perhaps, the first to grow the nuts, having a crop from his trees in 1881. The tree is very ornamental and well suited in every way to the climate of California or those regions where the almond tree thrives. It is an exceedingly deep and rapid rooter, succeeding well in dry locations. On its own root it makes rather a low, spreading tree, although from a lot of young trees I have growing from seed produced in Fresno county, they are by no means dwarf in character, properly selected. Pistacia vera belongs to the Sumach order, is distinctly diecious, producing nuts on the pistillate trees only.

The Future.

The future of the nut industry in California is very bright. To avoid mistakes and disappointment, however, greater care should be exercised in the selection of soil and location, as well as the varieties to be cultivated.

Next spring many a man who is old enough to know better will pose as an amateur gardener.

Fertilizer For Berries.

What is the best fertilizer for all kinds of berries and how best to apply it? Is nitrate of soda good for strawberries and how apply it? I had thought of dispensing with the Cultivator, but find it is the best all-around paper yet.—R. A. G., Gardena.

Nothing is better than stable manure, if it is not too coarse and full of straw. For strawberries we always aim to apply our fertilizer before setting out the plants, as it is very difficult to apply anything, unless I except nitrate of soda, afterward. Strawberries in Southern California are grown in rows very close together and because of this there is little chance to apply fertilizer after the plants have been set out. We prefer the same method for all kinds of berries.

If stable manure cannot be had the following formula is the best I have found:

Five parts pure ground bone.
Two parts high-grade sulphate of potash.
One part nitrate of soda.
Put in another form it would be:
2000 lbs. ground bone.
800 lbs. potash.
400 lbs. nitrate of soda.

The ground bone and potash can be mixed and sown over the ground after it has been plowed, and then thoroughly incorporated with the soil by going over it a couple of times with the cultivator, followed by the harrow. If this is done, say February first or any time thereafter, the nitrate of soda can be mixed in with the others and all put on the ground at once. A ton of this mixture per acre will not be too much to use. But if this is done prior to February, it would be better to hold the nitrate of soda until the plants are in active growth and then apply it in the same proportion as you would if mixing all three. Nitrate of soda is soluble and if applied when crops are dormant it is soon leached away and the plants do not use it because they are inactive. With the bone and potash, however, it is different. They remain in the soil until every atom is used up by the crops. If not all appropriated this year, the plants will use it the year following.

Nitrate of soda is good for strawberries if not used in too large quantity, and if applied when the plants are in active growth. Too much nitrogen makes foliage at the expense of fruit. I never use nitrate of soda when I use liberal quantities of stable manure, because the latter always contains enough nitrogen for the needs of the crops.—Q.A.L.

Soil Analysis.

I would like to ask through your valuable paper where I can send soil to have it analyzed, ascertain what kind of fertilizer it should have to make it more productive? What is the probable cost? Any suggestion along this line will be appreciated.—By a Subscriber.

By writing to Agricultural College, State University, Berkeley, you will receive instructions as to how to select your soil sample. That is to be sent according to directions when it will be analyzed and repor made to you as to its chemical composition. We believe there is no fe for this service. We question, however, as to whether such analysis i of great value to most farmers.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

Red Scale.

Will you please tell me what t spray orange trees with to kill re scale? What is the best time of yea to apply it, and the number of appl cations? N. E. M., Santa Ana.

Red scale is a serious pest, and w would use the gas treatment if pos sible. If you cannot secure the tent apply soon a two per cent solution distillate spray.

Strawberries Dying.

Last summer the leaves aroun some of our strawberry plants starte to dry, and finally we noticed that th whole plant died. Do you think spra ing would do this any good? If s when and with what materials shou I spray? If not, what should I d —E. E. Ensher, Fresno.

The trouble is most likely caus by something working upon the root Without seeing and examining t plants, it would not be possible state definitely the cause of t trouble. I have often seen plants d that way when they lacked wate And sometimes they have died f me when the most critical examin tion failed to disclose any cause. B usually only a few here and the over the patch would die. Eviden it is not fungoid trouble, and therefo spraying would be useless. If t trouble seems worst on that part the bed that at any time failed to sufficient water, that may be t cause. Alkali will produce t trouble. Is the land free from alka In a section as hot as Fresno, I inclined to believe the trouble w caused by want of care in the irri tion.—Q. A. L.

Rhubarb.

How is rhubarb grown? Is it fr seed or plants? What variety is be What soil is best? Is adobe good raise it on? When is it plant What its care? T. G. B., Orange.

The ordinary rhubarb was lar grown by division of the root, but newer and more profitable "Crim Winter" is usually grown from s as its roots do not divide well. less one has experience with grow the seed, it would probably be be to buy the young plants. These sh be planted later in the spring. barb is not exacting as to soil, but lighter sandy loam is better than heavy adobe. Clean, ordinary ga culture should be given.

Honey Production.

What locality of California is ducing the most honey, and from w plants is it secured? E. C. A., M tain View.

Southern California, and especi San Diego county, is the heavy h producer of the state. White black sage are the principal ducers. Alfalfa in the San Joa Valley is proving a good pasture

RAISIN GRAPES.

Continued from Page 35.

that are useful for the purpose. If it is not cared to grow wine grape extensively, then a row every ten or twelve rows will answer very well. The Sultana and the Sultanina are trellised vines and add to the expense of handling. The sale of these seedless varieties of raisins are somewhat hurt by the seeded Muscat, as a commercial product. The tendency this year was to ship them green, and they are desirable and profitable for this purpose. As the years pass we are more and more confirmed in the opinion that all vineyards are cleaner and healthier that are sprayed with Bordeaux mixture every winter (4-4-40), we find necessary to raise clean table grapes. On the Muscat the rough "nigger heads" are full of fungus growths.

Careful sulphuring of the Muscat is important. The first sulphuring is done when the buds first swell and open, the next at blossoming time, and the third one when the vines need it. A warm year they rarely require the third sulphuring, while a cloudy spell will quickly develop mildew in a dirty vineyard. The sulphuring machine makes this work much easier and reduces the expense over one-half when compared to the old way of sprinkling from a can.

The worse pest we have had in the last few years are thrips and hoppers. These are thick at night, or rather at dusk. In driving alongside of a vineyard they blind the eyes of the horses and drivers. In the vineyard they cause early loss of foliage, leaving the grapes to sunburn.

Takes Capital.

A raisin vineyard represents a heavy investment nowadays, for sweat boxes and trays eat into money very fast. The trays are of wood, two by three feet in size; across the end are two-inch cleats. These cleats are made higher than the tray, to permit stacking and turning. The weather agent earns his pay in Fresno if he answers the telephone in September and October, for whenever a cloud no bigger than a man's hand appears every grower expects a terrible storm.

When Everybody Works.

When the message does come, "Stack your raisins," the big bell rings, every man on the ranch leaves his work and all hands pile up the trays. If it does not rain, some are ungrateful enough to growl. If it does rain, the raisins are stacked and the grower goes to bed to listen to the patter and pour of the rain. Perhaps all the next day it continues and he frets over the prospect of heavy dews after the first rain. This is one of the pangs of growing raisins.

Drying Points.

The life of a raisin tray is about nine years. After the third year the repairs increase until the tray is like the boy's jack knife: first new blades, then a new handle, until all the original tray has gone glimmering. The need, today, is for some substitute for wood for a tray and sweat boxes, as well as for packing boxes.

The ripening of the grapes are shown by the dulling of the bright green foliage, and when the juice of the grapes tests twenty-four per cent. Then the trays are hauled out and the flurry of picking begins. It is not long before the trays stretch along the rows full of the light yellow green grapes. The air is full of the soft sweetish acrid smell of the drying grapes.

After ten or twelve days of exposure to the sun the half-dried raisins are turned. This is quickly done by putting an empty tray on a full one and reversing them and leaving the raisins other side up, exposed to the sun. After a week they are stacked and let finished in the shade. This makes a more meaty raisin than if they are let finish entirely in the sun.

In former years the size of the bunches and berries counted as extra money, then the picking was carefully watched and paid for by the day. Now that all this has passed the work is contracted. This year the price was $15 a ton delivered in the sweat box. This is the highest price we have ever paid. The quality of the raisins has fallen steadily of late years. The first and second settings or crops are picked together, and many of the raisins are deficient enough in sugar to be merely dried grapes.

Raisins are not handsome in coloring and require more skill in adding color to them by ribbons and fancy paper than any other class of fruit. The ordinary package of commerce is not only expensive, but it is a hideous, unappetizing looking affair. The improvement of the clean white of the confectionery paper and soft shades of ribbons will help the appearance of the pack greatly. At present crude colors seem to prevail, with gold and silver trimmings. No one desires to eat gold and silver.

The packing of the raisin grape has become centered in the towns. The home packer is down and out in nearly every case. The cause has been railroads and the large seeders. The royalties on raisins seeded had to be paid and it has cut greatly into the raisin industry profits, for seeders and railroads charge all the traffic will bear.

Killing The Goose.

The packers, in dealing with the growers, have always shown a surprising lack of tact. One man among them that will always do right, when appealed to personally, has been nicknamed in derision. Moral honesty, the honesty advocated by Mr. Roosevelt, the honesty that is honest because it is right, has been largely lost sight of and mere legal honesty that serves to keep a man out of jail, has taken its place. The brotherhood of mankind has been forgotten by grower and packer alike, it has become a game of who can beat the other.

The present conditions are shown in the reluctance to plant Muscat vineyards among the old settlers. The wine men are trying to discourage the further planting of wine grapes. They certainly have stopped it for some time by the policy of this year's settlements. When money was scarcest and things looked the darkest, the wine association paid the growers in notes, at a low rate of interest, not due for six months. This was the loyalty they have shown in helping the credit of the people!

Resistants.

Phylloxera and pear blight are still in our midst. The vine disease has not reached Fresno. The vine disease would be like pear blight, a wipeout. It would not pay to fight it. So far our vineyardist can, like the good Indian, say, "Thank God that others are worse off."

In fighting phylloxera we have the experience of Europe in growing resistant roots. In Fresno it does not do to talk about phylloxera. In one vineyard, where vines were being removed as worthless, I said something about phylloxera, but the foreman was indignant and said, "Why, it is only muetoides on the roots." I smiled, for all my neighbors know so much more than I do, that it is useless to say much.

The right root on which to graft the Muscat has not as yet been definitely settled. In South Africa the Ruprestris Metallica has given good results. The Ruprestris St. George, that we all rushed for at first, is at present rather under a cloud, as it has not proven altogether satisfactory as a root fr Muscat. The present root that seems most promising is "1202 (M Norvedre Ruprestris) of France—American stock. This root has proven vigorous and seems to like Fresno conditions of a rising and falling water table.

Honesty the Best Policy.

After all, the grape industry in California is new, when compared with the old world. New industries must find their places in the world's economy. The new industry brings with it changed conditions in the world's markets. Time will balance some of the evils of bugs and bacteria. Fruit packing houses that live on the growers' money and hand him out "red ink" are of a necessity and self limiting. They are like bacteria that die from their own poisoning.

Let us not lose in the present times of depression the upward looking toward better things. By our reaching out help the little portion of the world around us, back to the old time industry and honesty, when labor had its own perfect reward in its honest pride of achievement, and when graft did not seize the money of the people. Let us live, laugh and rejoice that we live in a land of sunshine and flowers, that California is our home and our earthly paradise.

The Prune in California

Written especially for the California Cultivator.
BY H. G. KEESLING, EDENVALE.

The prune industry is written about by H. G. Keesling, of Edenvale, near San Jose. Mr. Keesling growes prunes, knows prunes and believes in their future. He is not one of the old-time writers for the Cultivator, but has at times furnished short articles for our readers. We hope he will come again.—Ed.

MANY people have seen and tasted prunes of some sort, but not all have eaten California prunes and a comparatively small number are acquainted with prunes of highest quality such as grow in California, and particularly in the Santa Clara valley and a few smaller locations of similar climate and soil.

The California prune known and planted as the French prune or Petite Prune de Agen, is known to commerce as the California prune, and as such is distinguished from other sorts of much inferior quality grown in less favored States.

The Italian prune grown in the north has nothing in common with the California prune except that at a much lower price it has a place in the prune market, where price is of more consequence than quality.

Leads the World.

The Petite Prune de Agen is a sweet prune, rich, meaty, very palatable and nutritious, healthful and more economical than the sour sorts. It easily leads the markets of the world from the quality standpoint, and as it requires little or no sugar in preparation for the table, economy and health go hand in hand in its use.

Location.

The prune tree is not hardy in colder climates than California; in fact, after many years it is being discovered that the territory wherein this fruit may be grown to perfection and in quantity to make its culture profitable is more limited than was at first supposed.

Even in our favored valley many prune trees are being pulled out each year in locations where for various reasons the quality or quantity was too low, and while many acres of new land are planted where the indications are for success, it is not probable that there will be any overproduction of first-quality prunes for at least many years.

Production.

That large crops of Oregon prunes, in conjunction with large French crops, may occasionally cause the price to drop too low for comfort to the grower; such conditions must be only temporary, for every time they occur the grower of small, poor or otherwise inferior fruit will feel the pinch when it falls below the cost of production, and out will come the trees.

Two years ago when the base price fell below 2 cents, some orchards were not picked at all, as the fruit would not pay for the labor of picking and drying. Such orchards were usually on dry uplands, over hardpan, alkali, etc., which so starved the crop that it could not reach the paying point. Many such orchards have been pulled out and a good crop of grain or hay raised.

But with the better prices of '06 and '07 new life in prune planting has appeared.

At this time trees in lots of 1000 cannot be had, the limited stocks of the nurseries having been exhausted. It is safe to infer that about all of these now plantings will be on good land, or at least near by orchards that have proven to be thrifty producers of A1 fruit.

Begins to Look Good.

With prunes on a 5-cent basis people with money to invest can hardly be criticised for reaching out for some of the easy money that such a price insures. We are also learning, as the years go by, how to help our trees to become more vigorous and prolific. Some of the early plantings that have had little care of the right sort until the tops were a mass of dry branches, ideal nesting places for the birds and breeding places for scale, spider and other vermin which, if not exactly detrimental to the life of the tree, were at least not good to look at, and in any case the product was not salable as prunes.

Some such orchards have been cleaned up, new growth has taken place, and the trees are getting ready to bear a crop of fruit again.

Sun Better Than Evaporators.

Some of the older fruit growers in the valley will remember the era of Coast prunes and the evaporator boom, both gone some years past.

The Coast prunes were good to look at and tasted good when fresh. The trees grew and bore well. But the fruit must be evaporated or shipped to a more sunny clime. I remember a packer who saw his opportunity and purchased largely of Coast prunes. They were put on the trays and apparently cured, dumped into the warehouse, then taken out and cured again, then dumped on boards in the sun and cured some more, and afterwards very unwisely packed and shipped East. It was while in transit that the cool and moist atmosphere of the coast again asserted itself, and they were on arrival turned down. They were also turned out and dumped.

It is by such experiences that we learn that climate has much to do with the growth of the prune. In fact, we think that we know that a climate too cool and moist will not produce good prunes, nor will its opposite—a dry and hot climate. Another thing we think we know, and it is that prunes well ripened and cured slowly in the sun, make a better grade of fruit than can be produced by any evaporator or even the ovens of France.

SCORCHED AGAIN.

Woodin & Little's big pump and gas-engine house "got theirs" with every body else at the time of the great San Francisco fire and after getting nicely down to business at 531-536 Mission street were given a Christmas present of another scorching on Dec. 26. Fortunately the scorching was not severe, at least not enough so but what the firm is now located at 70-72 Fremont street and are prepared to fill all orders promptly.

San Francisco surely has a nervy bunch of business men who are proving to the world that something which would appal the ordinary mortals has not discouraged nor disheartened them.

Woodin & Little are still handling the famous Gould's Pumps and the Standard Gas Engines, besides all kinds of pump and irrigation supplies.

Curing and Marketing Prunes

Written especially for the California Cultivator.
BY J. LUTHER BOWERS, MORGAN HILL.

While at the State Fruit Growers' Convention at San Jose a few years since, we were shown some beautiful cured prunes put up by Mr. Bowers. They were delicious fruit and caused much comment. The question was asked often: "Why can't all California prunes be put up like that." It will doubtless be a long time before all will be, but Mr. Bowers gives us an idea regarding the manner of curing. Note his distinction betwen "cured" and "dried" prunes.—Ed.

TOO MUCH stress cannot be laid on the word cured. There is a vast difference between a cured prune and a dried prune. To cure prunes, I would first have my ground under my prune trees in the best possible shape, very smooth and fine. Let the prunes get fully ripe and let them fall of their own accord to the ground. At this stage they are full of sugar. Pick up every five days. The period of ripening will be from 15 to 25 days. Dip the ripe prunes in boiling water to which one pound of the best concentrated lye has been added to every 50 gallons of water, changing the water every time two tons of fruit has been dipped. Never let the ripe fruit remain in the box over 24 hours, for should the ripe fruit go through a sweat, no power on earth can cure it, it may be dried but not cured. Remember this. After being dipped, spread on trays. When the prunes can be gathered up in the hand and given a gentle squeeze, then open the hand quickly and if all the prunes separate, they are then cured—but not dry.

The prunes are then ready for the cans. At this stage they are graded in three grades, viz.: No. 1, No. 2 and No. 3; 38 to 43 are No. 1, 58 to 63 are No. 2, 78 to 83 are No. 3. After grading, the fruit is filled into tin cans, holding 1¼, 2½, 5 and 10 lbs. each. The prunes are pressed into the cans solid, with a gang press, six cans at a time, the cans then go to the double seamer, here the tops are double seamed on without heat or solder. The cans then go to the sterilizing vat, here the cans are cooked for forty minutes.

This finished goods is now called "Caprues;" one pecularity of these goods is, the can has not been exhausted, or rather the air has not been taken out. There is no vacuum. Can, air and contents have all been sterilized and the fruit will keep for years in any country or climate. These goods have been packed for the last three years and have been shipped to almost every State in the Union, Canada, Germany and the Philippine Islands, and not one spoiled can has yet been reported. Nothing but praise is everywhere expressed.

Severe Test.

One of the severest tests the goods have stood, was the one made by the University of California, under the directions of Prof. G. W. Shaw. Under his directions, on Oct. 19, 1905, I packed a few cases, two of these cases were sent to the Philippines, and left there a year and returned and opened sixteen months after they were packed, and found to be in as perfect a condition as the day they were packed. When I first began to pack them, three years ago, I placed the price on the can, during my three years of experimental work I have not had any thing to come up to cause me to change this plan. During my trip East last year, introducing the goods, I found boxed prunes selling higher than my highest price for "Caprues."

The quality of "Caprues" is so far ahead of a processed-boxed prune that it would be folly to make the comparison. A very fine date placed by a poor quality of prune would be about how it would stand. The prices on the cans are as follows: 1¼-lb. can, 25c; 2½-lb. can, 40c; 5-lb. can, 75c; 10-lb. can, $1.40, other grades slightly lower. These retail prices are on the label, and will always be the same, regardless of crop conditions. The No. 1 label is buff, No. 2 is blue and the No. 3 is green. The price will be the same in Boston and Los Angeles. It is only a question of time and patience until the fancy trade will require all high grades of prunes to be made into "Caprues."

DECIDUOUS FRUITS IN NORTHERN CALIFORNIA.

Continued from First Page

sprinkled over the tree. The young worms are coated with a moist covering, which is exuded by them and which is necessary to their existence; when they are dusted this moisture is dried up and the worms no longer able to maintain their hold on the leaves, drop to the ground and perish. The red spider is another serious pest which often appears in destructive force during the dry summer months. This when on the cherry should be treated to a dust bath of dry sulphur. This has been found the most effective method of treatment for red spider on all forms of deciduous trees.

Pears a Surprise.

The pear crop of the past season has been somewhat of a surprise to our orchardists. The ravages of the blight for many years past have had the effect of greatly lessening the pear area in this State, and during the past three years it has spread with devastating force among the great pear districts of Northern California. It was feared that pear growing in this State would soon be a thing of the past on account of the spread of this disease, yet despite its destruction, there were shipped this year through one agency 1039 carloads of pears. Beside these, large quantities were sent to the canneries. Very little new planting of pears has been done of late years owing to the fear of the blight, and it is without question that pear growing here will rapidly decline, unless some effective remedy for the the diseased wood, as recommended by Prof. Waite, and as carried on under his direction is, undoubtedly, the most, as it is now the only effective remedy, but this requires unanimity of action, and an intelligence not to be found among all gorwers. And where orchards are in control of Chinese or Japanese it is practically impossible to get effective work done. It matters not, therefore, how thorough one man may do the work, or how much intelligence he may bring to it, if he has a negligent neighbor, who either through ignorance or indifference, neglects to properly cut out the blight, the work will be for naught. Very many isolated orchards have been saved, at least temporarily, by the cutting process, and upon these we must rely for our pear crops. It is not uncommon for diseases of this character to "run their course." That is, finding new territory they commence the attack with great virulence and afterwards, from some counter movement in nature, die out to some extent, and while still remaining in the country attacked, become less destructive. It is to be hoped that this may yet be the history of the pear blight, and while we may not hope to get rid of it, we may at least hope to have its destructive force reduced.

POTASH

in the fertilizer in generous quantities makes heavy yields of clean and sound vegetables and fruits.

Strong and lusty plants resist the attacks of insects and germ pests.

PLACENTIA PERFECTION WALNUT TREE, Cover.

DECIDUOUS FRUITS IN NORTHERN CALIFORNIA,, 27.

DECIDUOUS FRUIT CULTURE.—Culture of the Walnut, 28; The Future of the Fig, 29; Fruits of the San Joaquin Valley, 33; Raisin Grapes, 34, 35; Possibilities of Nut Growing, 37; The Prune in California, 40; Curing and Marketing Prunes, 41.

ORNAMENTAL GARDEN.—The Australian Nut; Willows for Baskets; A Hint on Eucalyptus; Hope for the Parcels Post, 31.

QUERIES AND REPLIES.—Fertilizer for Berries; Soil Analysis; Red Scale; Strawberries Dying; Rhubarb; Honey Production, 38.

EDITORIAL.—Irrigated Vs. Non-Irrigated Fruits; Fertilize Your Land; Average Product of Fruit Trees; Institutes; Planting and Irrigation; The New Year, 42.

AGRICULTURAL NOTES OF THE PACIFIC COAST. —Northern, Central, Southern, the Coast, 43.

PROFIT IN THE POULTRY YARD.—Poultry in the Orchard; Around the Yards; Chicken Information; Hiding Places for Mites; For the Beginner, 44, 45, 46.

GROWING EUCALYPTUS, 47.

LIVE STOCK AND DAIRY.—Fertility From the Dairy; Removing Afterbirth, 48, 49.

THE VEGETABLE GARDEN.—How New Varieties Originate; Peas As Money Makers; Markekting California Products, 50.

WITH THE CITRUS GROWERS.—Gum Disease, 51.

ADVANTAGES OF SHADE TREES, 52.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Eastern Citrus Markets; Citrus Shipments; Local Conditions, 54, 55.

IRRIGATED vs. NON-IRRIGATED FRUITS.

The impression prevails very generally that fruits grown by irrigation are not as highly-flavored as those not irrigated, and, therefore, the conclusion is reached that as good fruit cannot be grown by irrigation as by the ordinary rainfall.

On the contrary, a careful investigation of the subject will show that, by the intelligent use of water, coupled with proper cultivation, the finest flavored fruits of the world are produced. Where irrigation is a necssity, as is the case in parts of California, the conditions are similar to those of a great conservatory, and the intelligent fruit grower is master of the situation. He gives or withholds water at pleasure, or as he finds that his trées require it, and is not subject to the injuries caused by prolonged drouths, or excessive floods, as those who depend entirely upon the natural rainfall.

Unfortunately, not much attention is given to the proper use of water by the average cultivator, especially if an abundance is at his disposal, for then he is inclined to use it as a substitute for cultivation, to the ultimate injury of both fruit and trees.

Fruit grown by irrigation (so called) was first brought to the notice of the eastern consumer by importations from California, soon after the completion of the Central and Union Pacific Railroads.

The pears were large, very handsome, but deficient in flavor, and as it was known that irrigation was practiced in California, the deficiency in flavor was at once attributed to that, whereas, it had but little to do with it.

The earlier orchards of this State were planted along the margins of streams, or where the land was naturally moist, and water near the surface. The almost perpetual summer, and freedom from all kinds of insect pests, together with the unlimited natural supply of water available to the tree, produced the large, handsome fruit at the expense of quality. This is really non-irrigated fruit.

Where trees are planted upon mesa lands, with subterranean water fifty to one hundred feet from the surface, irrigation is a necessity, and, if judiciously used, the finest-flavored fruits are here produced.

Irrigate deciduous fruit trees thoroughly as soon as the crop is removed. This is of special importance if the winter rains are delayed; for, without sufficient moisture in the soil, the roots will not perform their duty in preparing the material for the next season's growth and fruitage.

FERTILIZE YOUR LAND.

"Feed the land and the land will feed you" was the maxim of the past, but the latest investigations have added a new rule, which is more pertinent and forecful, to-wit, "Feed the plant and the plant will feed you."

This means that we should apply the fertilizers intelligently, such as the plant requires, and at such times as it can take up and assimilate the food offered. It would be just as sensible to dump a month's feed before a horse, and tell him to help himself for that period, as to cart a year's supply of fertilizer into the orchard and expect the best results. In both cases a large percentage would be wasted, before it could be utilized by either animal or plant, and another large percentage would not be utilized, because not needed by either horse or plant.

The cost of fertilizing the orchard is a serious one to all fruit growers. It may be minimized by the use of peas, vetches and other green plant growths which supply nitrogen. We notice some of the most healthy groves in the country are those which have been fertilized with peas, to which has been added a reasonable amount of commercial fertilizer.

Finely ground meal from unsteamed bones is a complete fertilizer for fruit trees, as it contains the three principal ingredients required, viz., phosphoric acid, potash and nitrogen. It is not quite as active as the acid phosphates, but more permanent in its effects.

Acid phosphate is simply bone meal dissolved in sulphuric acid, to which is added gypsum, ashes, or other similar material as a drier. The practice of adding to this nitrate of soda is wasteful and unnecessary, as the nitrates are better applied separately and in more frequent doses.

AVERAGE PRODUCT OF FRUIT TREES.

A new comer to California asks, "what may one expect as a fair average production of trees in full bearing, and under proper treatment?" Given satisfactory conditions trees should average in the orchard:

	Tons per acre.		Tons per acre.
Apples	4	Walnuts	¾
Apricots	5	Almonds	1½
Pears	5		Boxes per tree
Prunes	6	Oranges seedling	12
Peaches	5	Oranges budded	6
Figs	8	Lemon budded	5

Of course, there are seasons when the output will be greater than is represented by these figures, then again there may not be so much, but the general average is as nearly what we quote as can be safely estimated.

INSTITUTES.

Conductor Neff announces the following Institutes: Carpinteria, Jan. 31 and Feb. 1; Nordhoff, Feb. 3, 4; Santa Paula, Feb. 5, 6; San Fernando, Feb. 7, and Burbank, Feb. 8.

PLANTING AND IRRIGATION.

It is a bad practice where irrigation is necessary, to plant deciduous fruit trees among citrus or semi-tropical fruits, or to mix deciduous fruit trees when they ripen at different periods. It is much better to plant each separate, and give or withhold water according to the needs of each.

Fruit trees of all kinds that have been properly cultivated will stand hot, dry weather successfully until Christmas, when they should have water if the rains have not commenced at that time.

Those who contemplate setting out deciduous orchards should begin now to perfect their plans for the coming season's planting, by getting the ground in condition and by deep plowing. A thorough preparation of the soil with an intelligent working it off is one of the first things to do, and nowhere will thorough, intelligent work count for more than in planting an orchard. We cannot be too emphatic in urging an early selection of strong, healthy trees from home nurseries, we mean from nurseries in California where the reputation of the seller is known and where you have an opportunity to inspect the trees as they stand. Take delivery trees, at the time they are dug; wherever possible see that they are carefully taken up and the roots uninjured and set as soon as received. By so doing the vitaliy of the tree will not have been lowered by the transfer.

In this connection recollect that now is a splendid time to make the application of all kinds of manures just before the heavy rains. If possible, clean up everything around corrals, stables, chicken houses, etc., as well as gather all old rubbish fit for the purpose and apply to the soil and let the early rains wash the active properties of it into the soil. A moderate dressing of artificial fertilizer is also beneficial at this time, but nitrogen, if put on at all, should be in small quantity, owing to its liability to be leached out of the soil by heavy rains.

THE NEW YEAR.

The Cultivator can see the signs of a prosperous year for California. Population by immigration is steadily increasing, and the charcter of the people coming into the State is of the highest. One bright omen in this connection is the fact that a large per cent of the new population is settling on agricultural lands and fruit lands of the State, thus adding largely to the producing classes. More fruit lands have been sold this winter, so far, than were sold last year, hence we regard the outlook as promising for the continued development of the State. We congratulate our readers on the successful year past and wish them a happy and prosperous year in 1908.

Shop Talk

THE DECIDUOUS SPECIAL of the **CULTIVATOR** is herewith handed to you and we are sure you will appreciate its value to all interested in **CALIFORNIA** deciduous fruits. It is a branch of fruit growing which is almost exclusive in some sections, but one which is capable of indefinite expansion, for while it is represented in every section of the State, there are some excellent locations which, as yet, are unused for the purpose.

Upon California will fall, in ever increasing orders, the demand for fruit, and it is up to the ranchers of the State to avail themselves of every opportunity to increase their knowledge of conditions and methods which will help them to accomplish the most.

The **CULTIVATOR** endeavors to help in every way it can and wishes to act as a medium through which the most practical and well posted men of the State can give the results of their experience. Each reader can be of value to every other reader by keeping in mind and using the question department of the **CULTIVATOR**, and also by mentioning to his neighbors whatever is read of value.

We want everyone who is interested to know about the **CULTIVATOR** and to get it regularly if possible, but in the case of this issue, if you have anyone in mind to whom it would be of value, we would gladly mail copies to them on request, as long as they last.

Here also is another attractive clubbing offer which we wish to suggest to you:

The World Today	$1.50
Suburban Life	$3.00
Cultivator	$1.00
	$5.50
ALL FOR	$3.00

In ordering, please always state whether same are new subscriptions or renewals.

Agricultural Notes of the Pacific Coast

Northern California

Lots of old hops are being sold as low as 2 cents per pound.

Large plantings of alfalfa will be made at Willows this season.

Many miles of snow sheds along the Southern Pacific have been destroyed by fire.

Woodland is doing extensive power plowing of fields, using the cable system.

The Sonoma County Poultry Association marketed 500,000 dozen eggs last year.

Humboldt creameries paid for December butter from 27 to 37 cents per pound.

Trinity county sheep men are testing the legality of the sheep tax law passed in that county.

Sacramento's mayor is making an effort at having more care given to the shade trees of that city.

Gridley warehouses are busy shipping many cars of grain. About two cars a day are being forwarded.

The Hop Growers' Marketing Organization is gathering strength every day and new sections are adding to its membership.

Healdsburg had a green Christmas in that its market was well supplied with green peas and "garden sass" from home gardens.

Greeks working in the Sunset colonly, near Yuba City, insist on using their old time hoe as they had it in their native country.

There are yet some crevasses along the levees along the Sacramento river which have not been fully protected since last year's storms.

The Department of Agriculture has forwarded from Washington a large number of rose cuttings to be distributed and planted at Santa Rosa.

A centrifugal irrigating pump weighing several hundred pounds was recently stolen from a ranch near Sacramento and taken several miles away.

The business men of Tehama county are taking an active interest in irrigation matters, and holding meetings to discuss means of securing government aid.

Tehema county poultry men are endeavoring to get together and ship poultry to San Francisco commission houses so as to command more profit for themselves.

Hollyberry gatherers near San Francisco have been driven from the mountains by armed guards to prevent the destruction of the shrubbery of the canyons.

Forestry headquarters which have heretofore been maintained at Nevada City will remain where they have been notwithstanding strong effort has been made to secure removal.

Lodi has a grape vine which grows grapes rather larger than the ordinary Tokay, of a light flesh color, and of a very fine flavor. One crate from this-vine sold in New York this year at $5.37.

A suit for damages is on at Sacramento wherein a rancher is suing the State for damage to land because of diverting the current of the Sacramento river so as to wash away some of his land.

Central California

Conductor Clarke held a farmers' institute at Dinuba last Friday.

The capacity of the raisin seeding houses at Selma is six carloads per day.

Plowing by steam is proceeding in a large way on Miller & Lux ranch, Kern county.

The Orchardists' Association at Watsonville held a monthly meeting last Saturday.

Nearly 55,000 prune trees have been sold by San Jose nurserymen for this season's planting.

Modesto nurserymen report great demand for deciduous trees and grapevines for planting.

The returns of the Citrus Fair at Lindsay were such that the management "broke even."

Selma is to have another raisin seeder to be built and equipped before next raisin season.

Poultry keepers about Hollister are agitating the formation of a State Poultry Keepers' Association.

Buyers are already on the ground endeavoring to contract for the coming cantaloupe crop of Turlock.

Soil Expert Mackie of the Department of Agriculture has just completed a soil survey of the Parajo Valley.

The January 1st edition of the Bakersfield Echo gave an interesting review of the agricultural resources of Kern county.

Orchardists wishing to plant deciduous trees at Gilroy find themselves unable to secure sufficient trees for that purpose.

The fight against the peach blight in much of the San Joaquin Valley has been very thorough during the past six weeks.

Modesto shipped 600 boxes of navel oranges this season. Many orange trees will be planted during the coming season.

The shipping of raisins which was discontinued a few weeks ago is now in full swing and Fresno packinghouses are again busy places.

The recent session of the Tulare Grange was an all-day one. One of the principal questions discussed was a State mutual fire insurance company.

The Fruit Growers' Union of Campbell handled about one-third the business of the previous year, but good prices prevailed for the fruit that was handled.

The State Board of Trade is urging fruit growers to use every effort to secure a favorable ruling from the Secretary of Agriculture on the sulphur question.

Shipments of oranges from Tulare county this year will be larger than ever before. It is estimated that the total output from that one county will be about 2500 cars.

At a recent meeting of the Orchard City Grange at Campbell a Christmas tree with Santa Claus and other interesting features were added to the pleasures of the evening.

Several large land owners in the Slough district west of Watsonville are considering the advisability of establishing a drainage district by which a large tract of land is to be reclaimed from overflow.

Southern California

Pomona orchardists are exasperated by orange thieves.

Large planting of walnuts will be made at Duaro, Orange county.

Coachella valley ranchers have made money on onions this year.

Celery for the holiday trade in Eastern markets brought good returns.

Coachella is producing some exceedingly fine cotton in an experimental way.

The canyon road along the river between Rincon and Olive is being improved.

Imperial creamery is found to be too small for present uses and is to be enlarged.

Los Alamitos sugar beet people are plowing and getting land ready for the coming crop.

Extensive trails will be made to the Forest Reserve in Ventura and Santa Clara counties.

Plenty of cars at hand for the citrus output is the prediction for this year's shipping campaign.

Hemet is so pleased with its original rural delivery route that it is petitioning for a second.

The Pomona Poultry Show is on this week, and is making a fine exhibit of high grade poultry.

The acreage planted to sugar beets about Buena Park will be more extensive this year than formerly.

Olive growers at Redlands are receiving better returns from their orchards this year than for years.

Riverside is contemplating more extensive culture of orange marmalade to dispose of waste orange crop.

Forester Harper of Los Angeles addressed the believers in beautifying roadways at Riverside last week.

Orange county has the largest section of land devoted to celery culture of any one section in the world.

Imperial county is planning for a big fair next year to show the great industries of the baby county of the State.

The big San Joaquin ranch below Santa Ana, Orange county, is already preparing for a big bean planting this spring.

A movement is on foot in Orange county to reduce the acreage devoted to celery. The Jap gardeners refuse to join.

The construction of fire breaks in all the Reserves of Southern California will be on a larger scale this season than ever.

From all sections in the southern part of the State come reports of extensive planting of Eucalyptus both for fuel and timber purposes.

First returns from the holiday oranges have been fairly satisfactory though the prices have not ranged as high as for last year's holiday fruit.

A dam is being constructed across the Mojave river near Victorville for the purpose of diverting water for irrigating Mojave desert lands below.

The Producers' Packing Company at Redlands met a severe loss last week in the destruction of its packing house with all graders, sizers, and other machinery.

The Coast

The Idaho State Dairymen's Association is being held this week.

An "all Oregon" fruit show is to be held in Portland January 14 to 16.

This is said to be the banner year for the Hood River apple district.

A Farmers' Institute will be held at Del Norte, Colorado, January 21st and 27th.

The annual Angora goat show is to be held at Dallas, Oregon, January 15th, 17th.

About 100 cars of onions remained in the State of Oregon at the close of the old year.

A 400-acre alfalfa field near Toppenish produced $60,000 worth of hay at two crops.

Glanders, which prevailed to such an extent in Idaho last year, has been nearly eradicated.

Corvalis, Oregon, has shipped over $15,000 worth of sheep to California within the last few days.

In some of the grain growing sections in Oregon threshing has been continued up to the present time.

The Idaho Live Stock Sanitary Board reports the live stock of that State as in a generally healthy condition.

The inspector of Marion county, Oregon, is making tests of spray material being sold to orchardists in that State.

The Clackamas County Horticulturist Society is discussing the building of a fruit cannery to operate on co-operative lines.

The Denver Feld & Farm reports a Colorado farm which produced at the rate of 66.35 bushels of wheat per acre this past season.

The college of Washington, located at Pullman, is conducting a short course in agriculture which will continue until March 13th.

A large stock of Oregon hops has been forwarded to London. The price paid to growers was said to be in the neighborhood of 7 cents.

Oregon sheep growers are somewhat inflated over the high prizes which were secured by their stock at the recent Chicago International.

A special meeting of the Stock Growers' Association of Grant county, Oregon, has been called for the 18th to meet the allotting officer of the Forest Reserve.

Baker County Wool Growers' Association members have decided to make an extensive campaign against coyotes and will commence this month putting out poison.

The State Horticultural Society of Oregon will hold a session which will be addressed by J. H. Reid of Milwaukee, and prominent growers from that State and from California.

The record run for the season for an Oregon thresher is held by J. C. Wright. He closed down December 10th after a five-months' run, during which he threshed a quarter of a million bushels.

The sentiment in favor of a hop growers' organization covering all the hop districts of the Pacific coast and along lines similar to those of the recent California organization, is growing in favor.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

POULTRY IN THE ORCHARD.

IT CERTAINLY seems to us that as we go from ranch to ranch and see how little thought the fruit raiser, and especially the deciduous fruit growers, are paying to poultry, that a few lines along this line will be in order. Many ranchers upon being asked if poultry hurts or in any way interferes with the crop of fruit will say that it benefits the fruit or rather the orchards, but that they have no time to bother with poultry, as fruit pays better. They never stop to think that if they made corrals for their poultry in their orchard that their crop would be still better. If poultry will pay where artificial shade has to be provided, will it not pay better if they can have the run of the orchard, where shade is plentiful during the warm days of summer and early fall. But as the trees drop their leaves it is getting cool, and the young stock has grown until shade is not so much needed. The early rains bring the worms to the surface where the ground is cultivated. They are turned up and are eagerly devoured by the chicks.

Many, many grubs are picked up by poultry that would bore into a good, healthy tree, causing not only damage to the tree and fruit the coming season, but making extra work in saving or restoring the tree to its normal condition.

An Easterner's View.

In talking to an Eastern poultryman and fruit grower, he said that he had carefully studied the conditions of his orchard and was thoroughly convinced that it paid him to have his poultry yard in his orchard for the benefit it did his orchard. The fertilizer alone was worth the cost of keeping the poultry.

I have known many to buy fertilizers, paying a liberal price for them, besides the time of hauling and spreading, when if they had secured a good flock of birds their orchards would not have needed any extra fertilization.

Two of the most successful poultry ranchers we know of sell all the droppings from the houses at a good price. One said he considered he got more than it was worth, but he could sell twice as much if he had it.

This only goes to show the successful fruit growers, who have studied the question of fertilization and made an analysis of poultry droppings, know that as a fertilizer there is no manure that equals it.

Good for Poultry.

We have given a few reasons why poultry benefits the orchard. Now we will try and point out a few advantages of the orchard to the flock. In the first place, it is generally conceded that for a flock to be healthy they must have exercise and be contented.

If your orchards are not fenced you can arrange an inexpensive, convenient, movable fence, with poultry netting, either fastened to the trees or made in panels, bringing the ends together and nailing. A brace can be put two feet from bottom and run to the ground at each joint or connection to keep the fence from blowing over. These corrals can be moved from one place to another as desired, either to cultivate or give the poultry fresh runs.

If these corrals are in the way or interfere with cultivation they can be taken down very easily while the orchard is being cultivated, but should be replaced and poultry turned in as soon after cultivation as possible, for this is when the flock gets the most benefit of the orchard. Nothing is better for a laying hen or young stock than insects and grubs.

In the fall when the leaves begin to drop a few handfuls of grain scattered among the leaves will furnish exercise for the birds and will do them a power of good scratching after it. Young stock seems to be stronger and grow faster when given free range, so if you have room let the youngsters have the run of the orchard, and we know you will be doubly paid, as orchard, flock and pocketbook will be in a more healthy condition.

• • •

AROUND THE YARDS.

If you are not prepared for winter, disastrous results will follow.

* * *

Trap nests will show you how to breed from your best layers.

* * *

Begin your hatching early, as the early birds catch the high prices, also the prizes.

* * *

A good layer is usually nervous; care should be exercised so that she may not be frightened.

* * *

An ideal bird for winter laying is a pullet mature by November first, strong, vigorous and of good laying strain.

* * *

Hens like broken or whole grain better than mixtures of fine, dry materials; yet they do not dislike the latter.

* * *

A good hen will lay about 175 eggs per year, and at the present prices there is a handsome profit from this source, and the hen will sell at that end of the year for almost or quite as much as her food will have cost.

* * *

It is evident that the secrets of egg-production consist in a good supply of grit, good health, plenty of exercise, pure food, green food, fresh water, cut clover hay and green cut bone, freedom from mites and lice, regularity in feeding, cool houses in summer and warm ones in winter and breeding only from good healthy vigorous layers.

Poultry Show Dates

Los Angeles, at Chutes Park, Jan. 6-12, 1908.—Second Annual Exhibition Breeders' Association of Southern California. Dr. Winslow, president; H. A. Meserve, secretary. Birds will be received January 1st. Judged by score card and awards read before public is admitted Monday, January 6th.

Pomona, Cal., Jan. 6 to 11, 1908.—First annual show of Pomona Poultry Association. Write C. C. McKey, 372 W. 2nd St., for remium list.

tive little pocket pieces we have looked into for a long time is a hand mirror in the shape of an egg, on the back of which are three little chicks printed on celluloid in colors. It is issued by the progressive poultry supply house of Henry Albers Co., of Los Angeles, and will be mailed free to any of our readers if you will drop the above firm a card asking for it. You ought to look into this.

* * *

Attractive.

One of the most attactive circulars to reach our desk hails from Orpington Reservation, where black and buff Orpingtons are bred in the purple.

The booklet is printed on fine plate paper illustrated with half tone illustrations made from photos of birds on the reservation houses and yards. Ross & Tate enjoys the reputation of having the best equipped and down-to-date poultry plant in the southern part of the State. If you are unable to visit the reservation and want to get an idea of this plant just send a postal card to Ross & Tate, Altadena, asking for the circular, mentioning the Cultivator and it will be mailed free to you.

CHICKEN INFORMATION.

There are six principal classes of poultry; namely, chickens, turkeys, geese, ducks, guineas and pigeons.

They form the sources of three kinds of products—feathers, meat and eggs.

The first named class supplies nine-tenths of the poultry products of the country.

The next three classes—turkeys, geese and ducks—are raised almost wholly for their flesh, which is highly prized, especially during the holiday season.

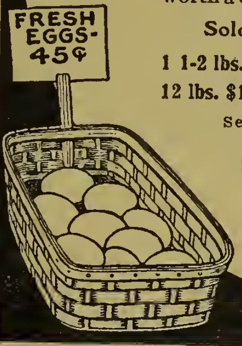
The guinea forms an unimportant group. So far as the commercial products are concerned, they have neither popularity nor merit.

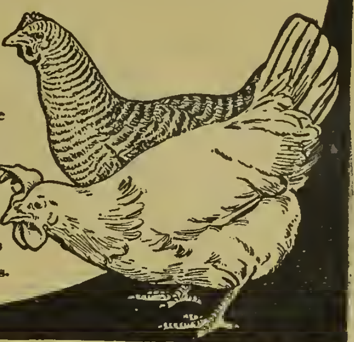
However, when thrown with another flock of poultry, they render valuable service as sentinels.

The pigeon forms a small, though by no means unimportant class. The highly-forced young pigeon, popularly known as the squab, finds much favor with certain classes of people. The popularity of the squab is likely to endure, for its flesh is tender, nutritious and wholesome.

Chickens have been divided into three groups, each comprising many breeds.

These groups are: First, the Mediterranean, egg producers and non-





When Eggs Are Eggs

How do you manage your poultry business? Are you content to gather a moderate supply of eggs in springtime when prices are low, or do you aim to get your greatest number during the winter months when prices are up and "eggs are eggs?" The way to succeed with hens is to do what others *don't* do. When your neighbors' hens are on strike, then see that yours "get busy."

If you will begin *now* to feed Dr. Hess Poultry Pan-a-ce-a your hens will not stop laying at all. Of course the moulting season is an "off time," but even then Poultry Pan-a-ce-a will make a few eggs, and if you continue to give it regularly, you will get an abundance all through the cold winter days when others get none.

DR. HESS
Poultry PAN-A-CE-A

is the prescription of Dr. Hess (M. D., D. V. S.) and is composed of elements which assist digestion, make good blood and cleanse the system of clogging poisonous matter. It is also a germicide and *prevents* poultry diseases. It has the unqualified endorsement of poultrymen in the United States and Canada, hastens the growth of young chicks and helps fatten old or market fowls. A penny's worth a day is sufficient for 30 hens.

Sold on a written guarantee.

HIDING PLACES FOR MITES.

Cracks and crevices are favorite retreats of the poultry mite. Such places are where they will always be found, if at all. The poultry house and all its fixtures should, therefore, be so constructed that there will be few good hiding places for these pests The roosts and nests are where mites are always the most numerous. Have the perches perfectly smooth and see that there are no more joints or cracks than are absolutely necessary. The same thing is true of the nest boxes. Both roosts and nests might well be painted with some thick preparation which will effectually seal up all cracks and then it will be easier to reach vermin with a lice-killing apparatus.

If the roosts or nests are attached to the walls of the building, this often causes trouble because it allows the mites to swarm over the walls of the building. In such a case the cracks between the boards on the inside of the hen house will be found to be filled with mites, which go forth at night to prey on the fowls on the roosts or in the nests. The cracks should be filled up with something that will do the work effectually and permanently. If they are not too large a good coat of whitewash with some of the thickest of the material forced into the cracks will aid in keeping the hiding places filled up. First of all, however, the roosts and nests should be so arranged that they do not come in contact with the walls of the building at any point, and then the hiding and breeding of the pests over the entire plant will be prevented.

In the building of a new hen house, all lumber should be matched stuff and the paint that is put on should cover the cracks effectively. It is much easier to fight lice and mites at the start than after they have secured a good hold on the place. The large, gray body louse stays on the fowl practically all the time, does not multiply so rapidly, is more easily reached and makes far less trouble, annoyance and loss than the red blood-sucking mites, which swarm by millions through a hen house of which they are allowed the undisputed possession.—Agricultural Epitomist.

HINTS TO BEGINNERS.

If only all who are thinking of embarking into any adventure with poultry would take to heart the following advice there would not be so many discouraging failures. It is unfortunate for one to enter into a business and fail because of ignorance or lack of knowledge of how to manage, and it is seldom that it is done in mercantile pursuits, yet hundreds attempt the poultry business under the supposition that anybody can "raise chickens." The fact is that the poultry business requires more skill in management than is required in raising cattle or other large stock. When a farmer has only two or more cows the small number enables him to learn the peculiarities of each animal and become perfectly familiar with them. He knows the kind of food they prefer, and should one of them become sick he quickly detects it and at once proceeds to use remedies, and if necessary, sits up all night to watch carefully over it. With a flock of fifty hens, however, the case is different. Although a flock of such size may not require much more room than one cow, yet there are fifty individuals, each requiring individual attention, and each being entirely different from the others in their characteristics and peculiarities, making it more difficult to understand their requirements. The ordinary farm hand seldom notices the poultry except to occasionally give them a mess of corn, and but few farmers give sufficient personal attention to thoroughly understand the management of the flock so as to derive the largest profit therefrom On the large majority of farms the owners do not know nor realize how many fowls they lose in a year from the numerous causes and dangers, and there are also hundreds of farmhens pay or not. If the beginner who is, perhaps, some person desirous of seeking a living outside of a city, on a limited capital, desires to succeed. he must pursue a course different from that usually practiced on farms. But how is he to know and how can he anticipate the various conditions under obstacles which he may meet? Even a small investment is a great deal when it represents all, perhaps the savings of years; hence the greater necessity of knowledge of all things before going into the poultry business. It is quite possible that a beginner may have great success the first year, but as a rule, such is not generally the case. The only safe mode is to begin with a few fowls, expect no profit the first year and but little the next, devoting the time to learning without incurring much risk, and the success will come later.—Rural World.

THE OLD WOODEN PUMP.

The old fashioned well sweep with [illegible] the past, but on many farms one still finds wooden pumps—squeaking wheezing, "craky" affairs that are out of order half the time.

No up-to-date farmer should be satisfied with wooden pumps. The pump is in such constant use that it should be of the very latest design and without a sliver of wood in it anywhere.

A high grade iron pump practically never wears out, and may almost be said to improve with age. The best pump to buy is one with a glass valve. Well pumps, power pumps, spray pumps and tnk pumps thus equipped can be purchased of any hardware or implement dealer.

Wooden pumps soon rot and becom unsanitary. If you are thinking of buying pumps, think twice before you put any money in a wooden one. Get the best iron pump you can find and will prove a source of satisfaction well as pure water.

Growing Eucalypts

Written especially for the California Cultivator.
BY W. A. T. STRATTON, PETALUMA.

The article below is written by one of the pioneers in eucalyptus culture. He has grown trees in all stages, and is now engaged in producing young trees at his nursery at Petaluma. There are some good points to be learned by reading Mr. Stratton's article.—Ed.

THE young plants of eucalyptus trees are not so easy to produce as those of many other trees unless it e the Blue Gum, which is comparavely easy. Many other varieties are ected with damping off and other oubles, which sometimes gives an xceedingly low percentage of plants om the seed used. But for the benit of those who may wish to make trial of seed planting, I give an tline of the work.

oil.

We use but a strong red loam which obtained from roadside, or pasture eld, that has not been cultivated. is we worked through a number sieve (four meshes to the inch,) ich thoroughly pulverizes it or removes all the coarser particles. Of is we take four boxes, then one box manure which has well decomposed, and work through the same eve. We then take one measure of nd, which is the purest, fine creek nd, clean and well washed. This screened through a number 8 sieve remove the coarser particles. This ixture, of course, is well mixed by oveling together, and used for filling e flats.

xes of Flats.

The flats should be three inches ep. Ours are uniformly made 14x21 ches inside measure.

Fill the boxes with the prepared il, firm the corners and sides, and ooth off the surface. This should done very carefully so as to give even, level surface for receiving e seed. Scatter the seed carefully d evenly over the surface. It is ell to firm the seed down into the il so as to insure actual close conct. Now apply the covering, which ould be the same kind of sand as at which was mixed in the soil. is covering should be about oneghth of an inch deep. Water carely and very lightly with fine spray, e the seed may be washed up to e surface.

Place these boxes in a warm but ady place, and cover with sheet uslin or lath frame. The greatest re must be exercised in keeping the ed and young plants supplied with oisture. Do not let the surface get dry at any time, neither should be made too wet.

When the young trees are two or ree inches high, remove the boxes full sunshine and see that they do t suffer for water. One bad wilt es a lot of stunted trees which will ver recover.

w to Plant.

The first step in successful planting to put the ground in the very best ssible order. You cannot overdo cultivate well and deeply. If a thing worth doing at all, it is worth doing ll. This all-important work, in the st stage of our work, is of the greatimportance. There are many places very many ranches that cannot be wed—as among the rocks or on ls so shallow that nothing will w. Among rocks the soil must be ked up in places designed to plant young trees at least three or four feet across, and as deeply as possible. In localities having shallow soil, or no soil at all, the pick must be freely used. One of the finest groves in this county is in just such soil. Pot holes were dug with a pick, two feet across by two feet deep. Loam was hauled up the hillside to fill these holes made in the shell rock. The young trees were planted under our special instruction. The first year they barely held their own, but the second after they were planted they grew up to 8 and 10 feet high, too, without any irrigation. I have in view another planting of eucalyptus, equally as interesting. It was made on a barren hilltop, the soil so thin and poor that nothing would grow. There was no soil to plow, nothing but a very hard yellow something—not with any name. At my suggestion a subsoil plow, with four horses, was used to plow furrows eight feet apart, the plow beam being weighted down with all the men it could hold. In the finishing off, a deep dead furrow was left to plant the eucalyptus. It was a dismal hope, but they did grow most vigorously and stocky, completely interlocking each other. It's owner now considers it his most valuable acreage.

The young trees, which have been grown in the boxes or flats should be so separated as to permit of being removed with a small bunch or ball of the earth. With a common kitchen or case knife cut down between the plants so as to have a small ball about the tender rootlets, taking care not to break up the little ball. If it is broken, it is probable the tree will not live. If care has been used, this can be done, especially if the soil in which the young plants are has been thoroughly moistened. Of course, if allowed to get too dry, at this planting time, the moment the attempt to cut is made with the knife dry dirt will immediately crumble.

Now, have the hole in which the little tree is to be planted in a dead furrow above mentioned, similar to that with the hole deeply dug and partially refilled with fine, fertile soil, at least enough to pack around the little rootlets. Now place the little trees well down in the hole and firm the soil about the roots, but use care not to crush the ball of earth. Cover with moist, rich soil, say two inches or more deeper than it was grown in the flat. This will place the young tree deep in the ground, but bear in mind the dry weather of the next summer will make it desirable to have the roots down where the sun's rays will not heat or dry out the soil too much. This deep planting is of the greatest importance.

If possible, mulch about the trees with weeds or straw, or anything that will shade and cover the gorund. Of course, the planter must use common, horse sense and make the depth of planting according to the character of the soil and the exposure. The coarser, gravelly soil will always dry out more and take the heat of the sun more than the heavier, more compact soil.

Distance Apart.

The distance apart in planting all depends upon the soil, whether dry or naturally moist. Also the nature of the variety to be planted. In general, I may say that for Blue Gums 10x10 feet, yet many planters in Sonoma county plant 12x12 feet, and some even more. You must also understand that when the soil is naturally moist and deep, closer planting than that is permissible. Shallow and coarser will dry out earlier and a greater distance is required between trees.

Care After Planting.

Do not for one moment think that these hardy trees will thrive on slipshod culture. It pays to do the work well, give them good care, if you wish good growth.

Do not trim the bottom foliage off the trees; let nature do the trimming. When the lower limbs are of no further use, they ripen up and die. By trimming up a tree, the growth is more slender, it becomes top heavy. They need the lower limbs to expand the trunk, nature will do the work very correctly, if you will but let her. It is far better to reduce the top. Don't think for one moment this cutting out the top will make a crooked tree. We have cut the tops out of trees 20 feet high, down to 10 feet; a leader started out, and in a few years no one would know the top had ever been reduced. This shortening in the top is very essential, where the fall rain soaks the ground so as to loosen the surface roots. In heavy winds, many will blow over or lean badly; the heavy foliage carries a heavy wind pressure; in such a case cut out the top freely. Straighten the young tree up; firm the soil around the tree with the feet. As a fact, it is well to go over all the trees before the ground gets soaked with water, and cut the tops out freely before they blow over.

The time to cut these eucalypti for fuel, or for that matter, any purpose, is when there is the least circulation of sap. During the low temperature of November and December they practically stop growing. The timber is then in its best condition for any purpose. Should the trees become frozen, immediately cut them down below the frozen wood. Do not let them remain with the frosted top. There is a circulation of diseased sap that kills the tree.

There are very many in our State who are exceedingly anxious to plant out large groves of these eucalypts. I advise caution—not to the planters of experience, but to those lacking experience. Go slow, do not invite failure. See what your neighbors have done, how they have succeeded. There can be no more money-making work on the farm than a grove of these trees, but to be successful you must study, and learn essential conditions.

Varieties.

As to the varieties and their good points there is sufficient matter under that heading for an entire article, if not for a book. In this grand family of trees are varities that grow on the highest Austrian Alps, and as hardy as an oak and others so tender that they are only suited to the warm tropical climate of the far south. In this family there are sorts that vie with the finest rosewood, mahogany, walnut or cherry. These valuable sorts are as yet in the experimental stages. The coming generation will reap the benefit of our very costly work, a work of love, not of money-making. During my 40 years of this labor of love, I have grown many millions and sent them to all parts of our coast.

Lost Strayed or Stolen—One Cow

That is about what happens each year for the man who owns five cows and does not use a **Tubular** cream separator. He loses in cream more than the price of a good cow. The more cows he owns the greater the loss. This is a fact on which Agricultural Colleges, Dairy Experts and the best Dairymen all agree, and so do you if you use a **Tubular.** If not, it's high time you

did. You can't afford to lose the price of one or more cows each year—there's no reason why you should. Get a Tubular and get more and better cream out of the milk; save time and labor and have warm sweet skimmed milk for the calves. Don't buy some cheap rattle-trap thing called a separator; that won't do any good. You need a real skimmer that does perfect work, skims clean, thick or thin, hot or cold; runs easy; simple in construction; easily understood. That's the **Tubular** and there is but one **Tubular**, the Sharples **Tubular**. Don't you want our little book "Business Dairymen," and our Catalog A. 260 both free? A postal will bring them.

FERTILITY FROM THE DAIRY.

GOLDEN butter comes from grass and corn grown on the farm. The golden cow transmutes it into commercial money of the world. The cow, as an astrologer has found, is the golden secret of building up the soil from which she takes her sustenance. She takes the herbage, using it for food for herself and her calf; then takes out the fat for the butter and returns to the soil nearly ninety per cent of all she has consumed. The wastes of the barnyard are also available plant food. The humus making materials of the bedding is saturated and enriched with liquid manure. The manure of cows is cooler and more lasting in action as a fertilizer than that of horses. It suits the conditions of the dry soils of California better than the hotter horse manure, as that dries out the land rapidly. Mix the two with plenty of old hay or straw and they make the best of plant foods.

Cover Crops.

The fertility locked up in the ranch soil is like having a first-class mortgage and using only the interest. Now, today, how many of the fruit growers are constantly expending, never adding to the reserve fertility of the orchards and vineyards. This is living on the principal of your bank account. The growing of a cover crop is again adding to the humus, but at the cost of producing a crop without cash returns. How much better it is to make these crops pay for themselves by feeding them to the cows. Vetches, peas and fenugrek are all good butter making foods. The roots of the cover crops are left in the soil and answer the purpose of penetration and opening up air and water channels as the roots rot. The weight of the roots is no mean addition of humus to the earth and is distributed deeper than the plow can turn under, but not deeper than the roots penetrate. The tops fed green or siloed, or cured into hay, add to the profits of the ranch. Fed to the cows they make butter worth $500 a ton, and yet ninety per cent of their value goes back to the soil. How many oranges will it take to have ten per cent of their value give these returns. Further, cows do not have to be sprayed or cyanided.

Lost Wealth.

How much available plant food is to be credited to a cow? Have you any idea? I fear not, or the cow would be an adjunct of every vineyard and orchard in the State. If the same materials were bought that a cow produces it will cost about eight cents a day, or a cow produces in manure about $30 a year. California is estimated to have about 450,000 dairy cows. Now, it is safe to say, to consider the herds around in the fruit sections as amounting to 150,000 head as available to increase fertility for the orchards and vineyards. Yet how few are using this source of fertility by keeping a herd of cows. The cows that are pastured on grass are adding directly to the fertility of the fields and when these fields in turn become fruit lands the fertility will be there.

Now in California the 150,000 cows that furnish available manure for the fruit lands are adding a by-product amounting to the neat little sum of $4,500,000 if it was used instead of often being wasted. If the manure of all the 450,000 cows was turned into money at the price of fertilizers it amounts to thirteen and half million dollars. A ton of alfalfa hay will feed a cow fifty days, and a quarter of a ton of corn will balance the ration for the same time. Now, if only ten per cent is retained by the cow to make milk and produce her calf it is a light toll to pay. In fifty days it is an ordinary cow, indeed, that will not average fifty pounds of butter or twelve and half dollars. Where cheese making is followed only whey comes back to the farm, there is a reduction of $4.13 per cow, and where milk is shipped away the reduction amounts to $6.40 from the yearly production of $30 worth of fertilizers.

Humus.

The decaying vegetable matter of barnyard manures combines with the potash and phosphoric acid and is almost at once in condition for plant nourishment. The various bacili come into action to break up the inert materials of the soils. Prof. Voorhees gives the following figures that apply here: A well fed cow produces 107 pounds of nitrogen, 87 pounds of phosphoric acid and the same amount of potash. The value of these materials is often lost by careless handling. One experiment was made with manure by dividing it into two lots, one lot was allowed to lie in the yard leaching all the winter. This sample lost 44 pounds in weight and nearly all the nitrogen. The second sample was carefully cared for and showed little loss. The two lots of manure were applied to corn and oats. The manure that was cared for increased the corn yield 59 per cent and the oats 29 per cent, while the leached manure increased the corn yield 36 per cent and the oats 9.5 per cent.

Fresh Manure.

The figures given show the importance of hauling the manure daily to the orchards to save the nitrogen. In California there is an objection to this, found in the lack of frost to destroy the weed seeds. Johnson grass, Bermuda and morning glory abound, and the bedding is full of these seeds. Then does a pit to rot manure before using seem to be advisable? There is a better way. Build a silo. A silo can be filled with weeds and the foxtail, alfalfa, the morning glory, Bermuda and Johnson grass will be well cooked. I have tried to sprout the seeds and joints of these pests after they came from the silo, but have not been able to make them grow. Weeds make poor silage and the cows will pick it over daintily, the waste goes harmlessly out with the manure and makes manure, so that it is well worth while. The land is cleared of weeds by their never being allowed to go to seed.

Balance.

If orchard and vineyard manuring is balanced to add the material lacking in barnyard manure becomes necessary. Every third year use bone meal in the fall followed with a light dressing of nitrate of soda in the spring. If commercial fertilizers are used exclusively the soil loses its mellow character and becomes dry and "fatigued" looking. It loses its water retaining charcter.

Conserving the manure begins at

Warranted to Give Satisfaction.

***Gombault's* Caustic Balsam**

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. ☞Send for descriptive circulars, testimonials, etc. Address

the barns using a good cement floor to keep all the juices. Then an overhead trolley to take the manure away to the waiting wagon adds to ease of handling. Land plaster (gypsum) is freely used in the stables as a deodorant. It fixes the ammonia or nitrogen. All the land in California, one is almost safe in saying, will produce better by the use of gypsum. This way of handling stable wastes does away with the malordorous manure heaps and keeps the flies from making breeding places around the yards.

Mellow Soil.

The dry refractory soils of the State, those that bake and turn up in clods are devoid of humus. These will become mellow and moisture retaining when filled with barnyard manure. I had one vineyard that was never in good heart. One time it would be too wet to plow and then ry out fast; one portion or another was always disgracefully cloddy. It was either bog or clod all the time. The vines had a pinched look and nade one sorry for them, they looked o thirsty for water; all the available nanure went on it and then old alfala stacks bought of a neighbor. Roughly speaking about a third was nanure covered, a third alfalfa covred and the remainder not treated. The results were noticable at once, or, for when the land was plowed he second time, there was no clods nd the vines assumed a brilliant reen on the manured portions. The art under the alfalfa looked well and as not cloddy, either. The untreated portion was cloddy and the ines looked even more disgusted ith life. The treated portion was nellow all season with moisture relned to the surface. This piece of and filled with humus has still an mproved condition after ten years of ropping.

ersonal.

When I had a large dairy and used e manure constantly on the vineards and orchards, the crops were henomenal in quality and quantity. fter the large herd of cows was old the vineyards have slowly lessned in product until they average e same as the neighbors. I know at a good herd of cows once ore on the vineyard, with silos filled ith corn will mean fancy grapes and eavy yields. Intensive farming by rowing corn and alfalfa, buying iddlings and oil cake was a basis profits that were hard to be qualed. Cows were golden in ineasing the bank accounts.

upporting Evidence.

In Germany steers are fed on the gar beet waste to produce manure. he profits are in the manure, for if e steer sells at cost the feeder is tisfied. It is no wonder when merica began to send dressed beef to these markets that the government saw the matter was serious in at it meant more than the loss of a w steers; it meant the crops of the untry. Balance is ever the way ture works, when man tries to imrove on nature's ways he does it at loss. Nature balances the crop proiced and conserves the fertility of e soil—by balancing the animal ting the crop to exact he pay.

What better have you to offer than e cow as a producer of fertility of e soil? Will you pay $1000 a ar for commercial fertilizers for the nd when that amount expended in ain and oil cake for cows will ing back more than the thousand dollars return in butter fat? Grow cover crops, feed them to cows and return the manure to the soil. Feed the land that fed you. When you go hence leave the earth richer, because you have given the few acres thought and care.

REMOVING AN AFTERBIRTH.

An afterbirth that can be removed without force or injury to the cow is in a condition to come away of its own accord.

In removing the afterbirth by main force it is only the body of it and such buttons as are torn off that come away, thus leaving many serious conditions. If the cotyledons or buttons are forcibly torn off, there is great danger of serious internal hemorrhage, as well as leaving a lot of clotted blood in the womb to decompose.

The parts of the afterbirth attached to the buttons are retained and undergo putrefaction, and the buttons torn from the womb leave raw sores, which become infected by the rotting, decomposing, irritating masses of foreign matter, of which a large per cent is absorbed by the system.

By using force, the horns of the uterus may be turned inside out. This will cause the cow to strain violently, and by doing so the womb is often expelled, the result of which is serious and often fatal.

The displacement of either or both horns of the womb will cause the cow to strain for some time. This condition may, and often does, cause barrenness.

It is for this reason that barrenness often occurs when the afterbirth is forcibly removed.

The afterbirth should be allowed to remain until the buttons are ripe and in condition to release it by its own weight. The afterbirth in this way acts as a drainage by keeping the mouth of the womb open. This allows the contents of the womb to escape, instead of being retained by closures of the mouth of the mouth of the womb.

In this case the animal would be compelled to absorb the poisonous matter, consisting of pieces of afterbirth which are always retained when force is used in removing it. Otherwise, the mouth of the womb would close and cause the womb to fill with matter, a portion of which is expelled, causing a catarrhal condition of the vagina, and acting as a hotbed for the germs of infection to propagate and multiply. This is liable to produce barrenness, and infectious abortion, and the cow, by absorbing a large portion of this matter, dries up on her milk, grows thin rapidly and is laible to become a victim of tuberculosis. If she contracts tuberculosis she may then expose the entire herd to the disease.—By Dr. David Roberts, Wisconsin State Veterinarian.

IN THEIR NEW BUILDING.

Gradually San Francisco's big merchants are getting into their new quarters and showing a fine line of goods, and displaying them under conditions more favorable than they could before the great disaster.

The G. W. Price Pump Co. has now removed to its new quarters where abundance of room, new stock and a good light are features which facilitate the transaction of business. The new location is at 16-30 Jessie street, 33-59 Ecker street and 27-37 Stevenson street.

The firm handles the effective and economically run Price Pump, also the Callahan Engine. These pumps and engines are well known to the irrigators of the State, as these two machines have proved such an effective combination in lifting water that they are scattered all over the State.

A letter to the Price Company at the new location will secure a catalogue of the pumps for any irrigator who may anticipate installing a plant.

The Vegetable Garden

HOW NEW VARIETIES ORIGINATE.

Of late years we have been relegated with stories of wizards and creators in the vegetable world until the common man has come to think that in order to produce something in the line of fruits and vegetables, one needs to be a scientist of the highest order. Burbank produced the potato which bears his name, from a single potato ball while yet a mere boy. The originator of the Concord grape produced this invaluable fruit from a chance seedling and made a small fortune from selling the rooted and other cuttings, yet though he spent the rest of his life in getting up new grapes, he only produced one other of any merit, and that one not of merit enough to be noted as a valuable addition to the family of grapes.

New Varieties of No Known Origin.

It may seem strange, but our most cherished of new fruits had no known originator; they like Topsy "just growed" among a lot of others. The Muir, Lemon cling and King Phillip's cling peach, the Loganberry, Tilton apricot, Eureka lemon, Navel orange are among these.

In the way of melons, we have in California had the Chilian watermelon and the Philippino watermelon just grown up among a lot of others. The hybrid Casaba was brought out by mere chance as was the Angeleno watermelon by myself. There was no attempt on my part to create a new melon. It just grew up among a lot of Chilians. Unlike the Casaba it is not a hybrid, but what scientists call a mutant, or what we common clodhoppers vulgarly term a sport. Hence it is subject to little or no variation, and it is singular fact that coming to us in this way it should stand as it does the peer of all standard watermelons. In color it is a deep red, very sweet and melting, with a spiciness peculiar to itself. It attains a weight of seventy-five pounds; makes hardly any culls. It is a remarkable fact that in spite of the thinness of rind it is one of the best shippers known; a melon of twenty-five pound weight will support a man weighing one hundred and sixty pounds and rarely show a mark. It is a vigorous grower and seems peculiarily adapted for hot and dry climate.

I am writing this to encourage the common people, of which I am but one, to try for something better than we already have. Do not look to the scientist for all things good and new. The large number of our most superlative fruits came to us through chance, not through science, so while we may rest content let us not be satisfied.—J. C. Ostergard.

PEAS AS A MONEY MAKER.

In the warmer parts of California peas can be planted with fair success any day of the year. A good many acres were planted just after our early October rains, and all look very promising. The chances are that peas that are planted this month will come on the market at the time the October crop is just going off the market, and will find ready sale at high prices.

Gardeners who have a large family of children should plant peas, as a twelve-year-old boy or girl can pick them easier and faster than can a grown person. Peas, as is well known, enrich the soil in nitrogen if the vines are turned under; they delight in decomposed granite soil, which is rich in phosphorus and potash on which they draw heavily. The Yorkshire Hero has for many years been the standard on the coast.

Use flat cultivation and keep the weeds out of the rows. When the plants are nearly ready to bloom put some sulphur in a sack and shake between the rows. Remember it is the sulphur fumes that kills the mildew and not the actual contact with the sulphur, and it takes the sun heat to bring out the fumes, so dust between the plants. In the winter time use the best sulphur procurable, as the poorer goods does not vaporize except in very hot weather.—J. C. Ostergard.

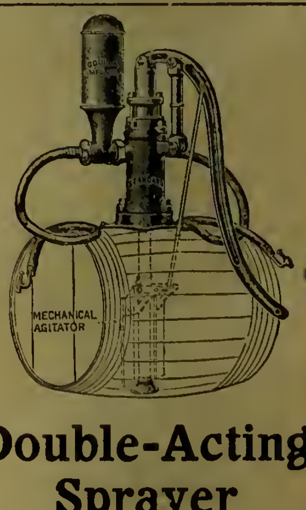
MARKETING CALIFORNIA PRODUCTS.

The Fresno county Chamber of Commerce tenders a very cordial invitation to attend the eighth semi-annual meeting of the Counties' Committee of the California Promotion Committee to be held in Einstein Hall, Fresno, on Saturday, December 14th, 1907.

The theme of the meeting will be "Marketing of California Products." Arrangements have been made with all the railroads for a fare and a third for the round trip on the receipt-certificate plan. Special rates to delegates and their friends have been made by all the Fresno hotels.

On the evening of December 14th, the delegates will be entertained at a banquet by the Fresno county Chamber of Commerce.

David Starr Jordan gave an address at Riverside on Eucalyptus trees, as he saw them at the recent trip to Australia.



Double-Acting Sprayer

With 3-inch brass-lined cylinder, brass-encased outside-packed plunger and brass valves. Large air chamber and long lever. Powerful enough for two leads of hose and four nozzles. Can be placed on end or side of barrel.

Complete outfit, including Pump with suction pipe and strainer, one 25-ft. lead of 1-2 in high pressure spray hose, 6-ft. iron pipe extension and one Seneca spray nozzle (no barrel or agitator) packed ready for shipment for $12.75.

In ordering state whether you want sprayer for end or side of barrel.

GUM DISEASE.

GUM DISEASE, or Foot Rot, or Mal-di-goma, has often appeared in different locations of California and in some cases has caused much loss and concern. The State University has placed the investigation of this trouble in the hands of Ralph E. Smith of the Whittier Station, who has been studying and experimenting for some months.

The result of his investigations will soon be given in a bulletin, but as some troubled subscribers have asked for immediate help, Mr. Smith has given for Cultivator readers a little advance information.

"I have your recent letter regarding the nature and means of control of gum disease. The feature of this trouble which needs most to be emphasized is the fact that the disease is not caused by any organism or parasite, but is purely the result of certain unfavorable soil conditions. There is, therefore, no danger whatver of infection or spreading the disease, and the only rational method of control cannot lie in any treatment of the tree itself, but must be brought about by removing or improving the conditions which produce the trouble.

"Gum disease has two principal forms, one seen most commonly in the lemon, consisting of a breaking out on the trunk near the surface of the ground, and the other commonly called 'scaly bark,' which is confined to orange trees and breaks out high up on the limbs, or on the trunk or in any portion of the tree. These two forms of the disease we have found to be identical as to their cause and are simply different manifestations of the same effect as occurring in different trees.

"Gum disease is caused primarily by an irregular water supply. It is found most commonly on heavy, poorly drained ground, on uncultivated ground, trees which are buried deeply in the soil, or on trees standing over shallow hard-pan, or where for any other reason the ground becomes very wet during irrigation and very dry between times. Many individual cases may be found which do not seem to follow this rule, but any extensive occurrence of the disease is almost entirely limited to some of the above conditions. Gum disease itself consists simply in the tree taking up more water than it can take care of, and a consequent breaking out through the bark of this water with the vegetable gum dissolved in it, as a result of mechanical pressure.

"The only rational treatment of the disease lies entirely in securing for the tree a proper and uniform supply of water. On soils which are naturally well drained and not too heavy this may be easily secured simply by regular irrigation and thorough cultivation close up to the tree. Where the trees have become deeply buried, especially in heavy ground, the earth should be dug away from around the trunk down to the main roots and the space filled in with sand or gravel up to the proper height, if this is feasible. In any event, the soil should not be allowed to remain packed about the trunk above the point where the tree was budded. In the case of hard-pan or any other soil condition which tends to interfere with a regular and proper supply of moisture, the condition must be improved by whatever means seems most practical.

"In the planting of new trees on ground which is likely to produce the disease, there are two features which deserve much more attention than they have previously received. These are the use of the best root stock for such ground and the method of budding the nursery trees a foot or more from the ground. In the first place, experience has demonstrated that the so-called Florida sour stock produces trees much less liable to gum disease and with no serious disadvantage. We therefore strongly recommend the use of this stock in heavy ground. High budding is also very advantageous under such conditions, and even on the sweet stock trees budded in this manner are very little affected by gum disease, owing to the fact of the union being well above the surface of the soil.

"As regards the treatment of the tree itself when affected, I would say that if the tree has gummed badly it is desirable to clean out the affected tissue and protect the wound with some covering just as would be done with any other injury. A wax composed of about four parts of beeswax and one part of resin, with a little oil added, the whole to be melted together and put on with a brush while liquid, is perhaps as good as anything for this purpose. Before putting on the wax all the bark that is badly affected should be carefully and cleanly peeled off. It is not, however, necessary to strip the tree very severely where the bark is not entirely dead, as in many cases it will recover of this if soil conditions are improved. It should be particularly understood that this bark treatment is not in any way a cure for the disease, but simply a local treatment for the wound produced by the disease. The only real remedy must lie in improving the soil conditions and bringing about a uniform water supply, which is the fundamental consideration in the handling of gum disease.

"I may say that we are making a very thorough study of this whole matter, which in due time will be published in extended form.

RALPH E. SMITH."

The next Cultivator special will be devoted to Citrus Fruits and will be issued February 13.

New officers of the Cloverdale Citrus Fair Association are W. T. Brush, president, Chas. E. Humbert, vice-president, Geo. B. Baer, secretary, and in addition to the above John B. Cooley and S. Spinschower, directors. The date for the coming fair has not yet been fixed.

Sour and Sweet Orange Seed Bed Plants
The Finest Lot in California

My sour orange plants are grown from seed off the wild orange trees of Florida. Trees grown on this stock are very desirable for planting in heavy soils or lands that are subject to excessive moisture or drouth. Its most valuable feature is its resistance to gum disease.

My sweet orange plants are grown from seed off very large, old Tahiti seedling trees, thus making the very best foundation to grow an orange orchard on. Don't fail to see my stock before you buy, or address

Advantages of Shade Trees

Written especially for the California Cultivator.

BY J. H. REED, RIVERSIDE.

J. H. Reed is the tree warden of the city of Riverside and a life long enthusiast in spreading the gospel of street ornamentation. He does it because he loves beauty, also because he believes that, financially, it is a winner. At Riverside he has free hand and the backing of almost the entire community, so that in time we believe Riverside will be pointed to as a model in the beauty of its roadsides. May we have more Reeds.—Ed.

THE distinctly fruit growing sections of the Middle West and far Eastern States are isolated and much scattered; but, as a rule, wherever found, the towns about which they center are the most attractive of any the traveler meets. The fruit industry naturally attracts people of intelligence, culture and good taste. California is already rightfully known as the fruit garden of America. Its fruit centers, at least, settled as they largely are by intelligent, cultured families, should legitimately be especially attractive places, and this should be a land of beautiful towns.

Trees Give Great Beauty.

It is generally conceded that there is no feature of adornment that adds so largely to the beauty of a village country roadway as trees, properly chosen, preperly planted and properly cared for. In fact, it would be difficult to conceive of a really beautiful community without street trees. Yet we find comparatively few California towns, even in our prosperous fruit growing districts, beautiful to any considerable extent with street trees, and where they are found the trees are frequently badly chosen and illy cared for. It is true many of our towns have special spots, sometimes entire streets, well beautified, the result of individual enterprise, but they cover only limited portions of the whole, the rest remaining discouragingly bare.

Too Busy.

In seeking for satisfactory reasons for this we will not find them in the lack of appreciation of the value of street trees for comfort or pleasure, or as an actual pecuniary asset to any city, but rather in the fact that property owners generally are too busy to give the matter the time and attention necessary to make the plantings successful and popular, and our city governments are but just beginning to recognize the fact that street adornment is as legitimate a part of their business as making the streets themselves.

Had we given the same kind of intelligent effort to beautifying our streets as we have to developing our orchards during the past 15 or 20 years, our California towns would now be the most beautiful found the world over, and besides the esthetic value it would have given, the added pecuniary value which would be difficult to estimate.

I was riding in one of our most beautiful California towns with one of its prominent business men a few days ago. Passing through a portion of the city which had been early and wisely planted to street trees, and well cared for, I said to my friend. "Supposing all the streets of your city had been planted like this when first improved, as this was, and continuously cared for as this has been, in your judgment, how much would it have added to your present taxable property valuation? He promptly said, 'fifty per cent.'"

That city is receiving taxes now on a valuation of several millions. One-half of one per cent of the annual valuation as the town developed, spent on beautifying its streets, would have made the entire city now as beautiful as the part we were driving through. Had this enhanced the valuation over what it is now but by 10 per cent instead of 50, we see at once the enormous advantage of beautifying our towns while they are building. And this money con-

THE FUTURE OF THE FIG.

Continued from Page 29.

The fact that these figs do not all mature at the same time is a very important feature and one which will appeal to every fruit grower. It means that a very large crop of fruit can be harvested with a small force of men, or even children at a minimum of expense. These figs must not be picked from the trees, but allowed to drop to the ground of their own accord. This they will not do until they have shriveled and lost their form. Occasionally a fig will be seen which does not drop readily. A slight jar to the tree, or tapping it with a light bamboo pole, will cause it to fall.

The figs are gathered in small buckets, and later are taken to the drying ground in picking boxes. Before placing the figs on the trays, they are immersed in a boiling hot brine for half a minute, containing about three ounces of salt to the gallon of water. After a few day's exposure to the sun they are taken to a room, sealed tight with tongue and grooved lumber, and placed in a large pile. Here they remain for ten days, being turned occasionally. This sweating, as it is termed, equalizes the amount of moisture in the fruit. Overdried figs absorbing moisture from those which are too wet, and vice versa. Before the figs are taken to the packing house, they are washed in a weak, cold brine, the overdried figs, called floaters, are removed as they float to the top, and the others are given a good rubbing between the hands. This removes the dirt, which may have been gathered on them in the course of drying. After exposure to the sun for a half day to allow the superfluous moisture to be removed, they are dumped into boxes and hauled to the packing house.

The packing is done by women and girls. Every effort is made to have the fruit in the best of condition and perfectly clean. Just prior to being taken to the packing table, the figs are given a steam bath. This cleanses them thoroughly and heats the fruit through, and should any insect have laid its eggs in the fruit during the course of drying, the germ is destroyed. No such care is exercised by either the growers or packers in Smyrna, and in consequence of this, the imported figs are not only wormy but are dirty as well, due to the crude manner of handling. The figs are packed in paper cartons holding half pound and one pound each, and are then packed in wooden boxes holding respectively ten pounds each. So much for our method. Contrast it with the method followed in Smyrna.

The Fig in Smyrna.

There the figs are dried on rushes, on an open place in the orchard, where a few trees have died. When sufficiently dried, the fruit is dumped on the ground in any convenient old shed and allowed to remain until enough has accumulated, when it is gathered up and dumped into horse hair sacks holding about two hundred pounds each. These sacks are very strong and quite expensive, and are very desirable for the transportation of figs, for they have no lint like burlap sacks. The figs are carried on the backs of camels to the nearest railroad station, a camel load being two such sacks. The figs on reaching Smyrna are again conveyed on the backs of camels to the fig bazaar, or to the packing houses. They are dumped on the floor in immense piles about three feet deep. Before packing, the figs are first sorted into sizes, and suppled by women and girls, who receive about fifteen to twenty cents a day. The packing is done by men entirely.

Commercial Value of Figs.

To produce a good article possessing merit is always a source of satisfaction, but there is another incentive in addition to this. The industry must be profitable. No business can succeed or make any advance unless it pays. The question arises, will fig growing pay? True, we must compete with the cheap labor of Europe, but this has been the fact in other branches of fruit growing. Nevertheless, we are competing and our fruits sell in competition with the best that is produced in the old world. Although our wages are much higher it must be remembered that our laborers are more efficient, and this, combined with the advanced methods of handling, places us in a position to compete in figs as well as other fruit. It has been demonstrated that Adriatic figs at three cents a pound are more profitable than raisins at five cents. Smyrna figs can be raised fully as cheaply as Adriatic figs, the only additional expense being caprification, but as this does not cost over two cents a tree at the very outside it is a matter not worthy of consideration. It is safe to assume that Smyrna figs, even when produced in large quantities, will never bring less than three cents per pound, and for many years to come, five cents per pound will be a closer average. No class of dried fruit outside of the fig possesses so many healthful qualities, and with a good article on the market, there is an unlimited field open to expansion. With the figs which were being marketed from this State prior to the successful establishment of the Smyrna fig industry there was no hope for the future. It is now conceded that this trouble was due to our not having the right variety and to no other. It does not indicate, because a fig is of the Smyra type, that it necessarily is the variety for drying, any more than that one of our June peaches is a good drying or canning peach.

Fig Land in California.

There are thousands of acres of land in California, in the interior valleys, in which this fig can be grown successfully and profitably. True, the fig will grow any place in the State where the therometer does not go below 18 degrees Fahrenheit. As a commercial proposition, it must have a dry, warm climate during the summer months, and it will, therefore, always find its most congenial location in the Sacramento and San Joaquin valleys and in the foothills where such conditions exist. The trees will grow on either wet or dry soils, but a deep, warm soil with good drainage will always produce the best fruit. No orchard can be raised with so small an expense as a fig. Good cultivation is, of course, important, but outside of this and irrigation, the other expenses are very light. Pruning is a small item, no spraying is necessary for the trees are never subject to attack by insect pests..

The importation of figs into the United States amounts to over $800,000 annually. This alone demonstrates that there is an opening for the development of this industry. There is no fruit which can be put to such a variety of uses as the fig, and the demand for this fruit canned or preserved has never been satisfied, even with the ordinary figs. How much this will expand when this new fig is more widely disseminated, it is difficult to estimate.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Jan. 8, 1908.

Butter.

Butter is yet quoted at the same price, but there is a desperate effort on the part of some dealers to hammer down quotations. The supply in hand is so small that there is little apparent reason for a downward trend. Immense quantities of storage is being drawn out, claimed for the purpose of forcing down fresh creamery price.

Creamery extra per roll	75@77½

QUERIES AND REPLIES.

Continued from Page 38.

This is a form of indigestion produced by improper feeding. The first thing to do is to administer two fluid ounces of castor oil, to which may be added a short teaspoonful of laudanum. After this has operated give:

Bismuth, two drachms;
Magnesia, two drachms;
Tincture of Kimo, one drachm. Mix well.

This solution may be given in milk. A little scalded milk is beneficial, and a raw egg with the shell is also good. Crowd into the throat and crush so that the whole may be swallowed.

Blindness.

I have a three-months-old almost pure blood Jersey calf, that I have raised on skim milk with a mixture of oilmeal, cornmeal and shorts well cooked, added to milk, then for some time she has been eating alfalfa hay and green corn fodder, her coat has looked rough for some time and otherwise she has seemed well.

One day last week she got loose. When I found her she was suckling the cow and seemed to be overfull of some kind of feed. In leading her along to tie her up she seemed to stumble along, not knowing where to put her feet. When I fed her the milk I found she was blind. That was four days ago. She still continues blind, eats well. What causes the blindness? I thought perhaps eating deadly nightshade might dilate the pupils. In that case she will recover, but she seems no better. A. L. H.

I do not know. It is certainly a curious case. I hope you will report on its sequel later. M. E. S.

The director of the reclamation service in a recent report discusses irrigation projects in Idaho giving special notice to the Payette-Boise project, which is undertaking the reclamation of 372,000 acres of arid land.

San Francisco Markets

SAN FRANCISCO, Jan. 7, 1908.

Butter.

Butter has declined materially during the past week and the tone of the market is rather weak to the extent that it is now hard to command even the quotations.

The current prices on dairy products in San Francisco are always from 2 to 3 cents higher than the rates given in the daily official list of the Wholesale Dairy Produce Exchange. The retail dealers in this city invariably pay an additional 2 cents per pound on butter and per dozen of eggs, and occasionally it is 3 cents. On cheese the increase is 1 cent per pound. By making these additions to the Dairy Exchange prices the producer in the country can always determine the actual prices ruling in this city. The quotations as prepared by the San Francisco Wholesale Dairy Exchange yesterday were as follows:

California extras per lb.	30@31
California firsts	26½
California seconds	25
Eastern extras	24½
Storage Cal ex	24½

Cheese.

California young American fy	16

Hay.

Somers & Co. say:

Arrivals of hay have been very heavy for the holiday season, the total for the week ending today amounting to 4040 tons in comparison with but 2550 tons for the week preceeding. As a general rule, we experience a very quiet market Christmas time and with present conditions this fact was very noticable this year. Therefore, although hay showed some recovery about ten days ago, yet during the past four or five days there has been a decidedly weaker feeling aagin. It is generally anticipated that with the turn of the year a better trade and corresponding prices will be noted.

A continuance of light rains has naturally done its part towards insuring a prosperous season for 1908, although it is far too early as yet to anticipate concerning the new crop. The effect of the rain at present rather helps the weakness in hay. Our total rainfall thus far has been far below the average, but it is the later showers that really regulate the amount of our crops.

ADVANTAGES OF SHADE TREES.

Continued from Page 52.

sideration is by no means the largest return.

That these facts are being appreciated more fully than heretofore is indicated by the greater activity in street tree planting and the frequent inquiries from city authorities as well as individuals as to what and how to plant.

* * *

Some Definite Suggestions.

The Cultivator has asked me to give some conclusions from my study and observations of and experience with street trees in recent years, as to desirable varieties, etc. Here at the South, with our semi-tropical conditions, I not only advise, but earnestly urge planting evergreen trees, unless for some special local reason. Our evergreen trees are not only in keeping with our climate and other conditions, but they serve us the year through. During their long, bleak winters in the East, the naked deciduous trees do not look so much out of place. Their bare branches are rather in keeping with the winter surroundings, and they render some compensation for their long nakedness, by preceding it for a season, in taking on their most brilliant dress of the year.

With us the deciduous foliage in early autumn slowly turns to a dull brown, and the trees at once begin to look utterly out of place, in contrast to the bright cheerfulness of the blooming flowers, the green lawns and bright foliage of our evergreen trees. It takes but a few of these brown, and later on naked trees to spoil the brightness of a whole street.

There is another consideration. While I do not favor specially catering to the notions of our numerous winter visitors to our own inconvenience, I think, as hosts, we should take some pride in what adds most to their pleasure while sojourneying with us. There is no feature of the country that delights the tourist more than the winter drives over good roads through our beautiful tree-lined avenues.

So, I say, plant evergreens, as a rule, at the South at least.

* * *

The Beautiful Pepper.

For evergreen shade trees the pepper stands as conspicuously first as a street tree for California, as does the maple in the Middle West and the elm in New England.

Properly grown and cared for—and this means all the difference between a straight, smooth-stemmed, vigorous, well-balanced tree, and the crooked, gnarled stemmed, ill-shaped topped tree so common on our streets—I think the pepper the most graceful, beautiful shade tree grown in America for street purposes. The black acacia—Melanocrylou—is proving one of our most desirable street trees. Its dense, dark green foliage is of a pleasing shade. If allowed to take its natural shape, it has a comparatively narrow spread of branches, and in its early stages of growth, assumes a handsome pyramidical form, but if the top is cut back after a few years' growth the body widens out, often making a spread of 20 to 30 feet, becoming a beautiful, shapely, umbragious tree.

Long Lived.

Both the pepper and black acacia are long lived trees. While they respond quickly to good care, they will stand much hardship. With proper cultivation they will do fairly well with little water after once being established.

The Palm.

Where shade is not desired I consider the palm one of our most valuable ornamental street trees. There is something about the palm that especially appeals to cultured taste everywhere. There is no plant more universally found in public and private collections, in greenhouses and as house plants, in climates too cold for it to flourish in the open. While we must wait some years for most other trees to make much showing on the street, the palm is an attractive, beautiful plant during its early stages of growth. When grown there is no more stately tree giving especially striking effect in long avenue plantings. While it is said that the habitat of the palm is with "its feet in the water and face in the sun," and doubtless does best in a warm, moist climate; with a little special care while young, it does well in most parts of California.

For a Hundred Years To Come.

I have left myself no space to discuss other of our desirable street trees, and close urging most careful consideration in chosing varieties, which, if suitable, should beautify the street, giving joy to the public for a century.

COBURN'S ALFALFA DONT'S.

In his book entitled, "The Book of Alfalfa," Secretary F. D. Coburn, of Kansas, gives the following list of don'ts:

Don't sow any nurse crop.

Don't sow on freshly plowed land, no matter how carefully prepared.

Don't let weeds or grass grow over six inches high without clipping.

Don't clip or mow when wet with rain or dew.

Don't let alfalfa stand; if turning yellow, cut it.

Don't sow old seed.

Don't sow less than 25 pounds per acre, one-half each way.

Don't sow on land that will not raise 250 bushels of potatoes per acre.

Don't sow 25 acres at first; sow five.

Don't pasture it.

Don't put any of the rotten manure anywhere but on your alfalfa plot.

Don't depend upon "culture cakes" or soil from some distant field.

Don't let it go if a thin stand, but disk in more seed; don't be afraid you will kill it.

Don't replow the land, disk it.

Don't wait for it to stool; it never does.

Don't try to cut for hay until the alfalfa takes the field.

Don't sow on any land not well underdrained.

Don't leave your land rough; use a roller or a plank float to level and smooth it.

Don't give up.

The 16th annual meeting of the Washington State Dairy Association was recently held at Stanwood, Washington, when the following officers were elected: E. J. Ross of Bethel, King county, president; I. S. Thomle of Stanwood, vice-president; Ira P. Whitney of Pullman, secretary-treasurer; B. F. Reed of Ellensburg, W. J. Langdon of Sumner, and G. R. Silbey of Chehalis, directors.

Pumped by

The New Pomona Deep Well Pump Head

Pomona Mfg. Co., Pomona

Riverside, Cal., October 8, 1907.

POMONA MANUFACTURING CO., Pomona, Cal.

Gentlemen:—In reply to yours requesting privilege of photographing our pumping plant which you installed for us last spring will say: You are perfectly welcome to take as many photos as you wish, and as our season for pumping is practically over, it may be of interest to you to know something of what we have been doing with it. We have raised forty inches of water about two hundred and fifty feet, delivering it through a six-inch pipe line to our reservoir about one and one-half miles distant from the well. The pump is driven by a forty-horse power electric motor, and our tests have shown the actual horse power used to be twenty-seven horse power. The pump has worked perfectly all through the season and is in perfect condition today. It has come up to all that you represented it and met our every expectation. Should you wish to refer to our plant at any time, you will always find it open for your inspecition. Yours truly.

A Beautiful Road and Avenue Tree

Courtesy Out West

Eucalypts are native to the coast region of Australia and Tasmania, where at least 150 distinct species are recognized. More than 100 species have been introduced into the United States. They are, however, adapted to a subtropical climate, and only a limited portion of this country is favorable for their growth. The possibility of growing eucalypts in any region is determined by the amount of cold that the young trees have to endure. Few of the species can survive a temperature below 20 deg. F., and none of them a temperature of less than 12 deg.

In general, eucalypts may be successfully planted in the sections of the United States suitable for the culture of citrus fruits. They are grown in nearly all the agricultural sections of California, along the coast of Southern Oregon, and to a limited extent in Arizona, New Mexico, and Western Texas. Several species have also been planted in Florida and along the Gulf coast. Here, however, occasional frosts have killed or severely damaged the trees, and for this reason planting has been discouraged.

Eucalypts have been planted most extensively in California, and here the value of different species may best be determined. The rate and habit of growth of the blue, sugar and gray gums and a few other species make them superior to other eucalypts and recommend them especially for commercial plantations.

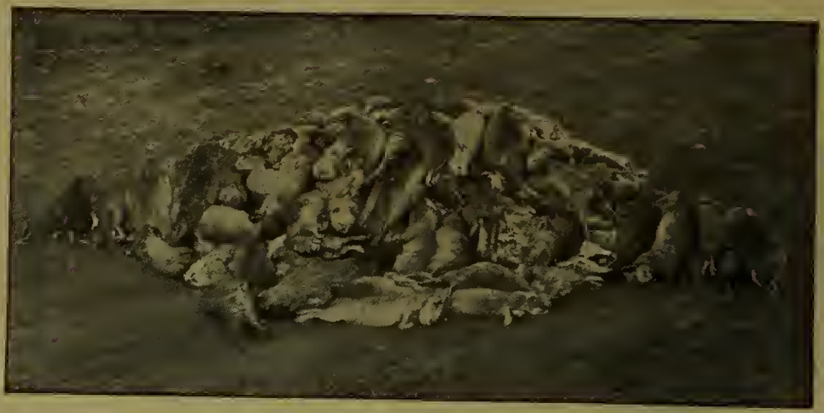
Now is the time to go for gophers with

Bille's Gopher Poison

The Gophers go for it and it will go for them good and plenty every time



This is a photo of 201 killed in one day on a ten-acre field before they could get back to their holes, with one bottle of BILLE'S COPHER POISON.

Endorsed by Agricultural Colleges and Experiment Stations. Has had greatest success for years in the Middle West, and also here in California last season. It is most attractive to gophers, squirrels, etc, and sure death to them. One among many, Amos. L. Grigsby, Campo, Cal., writes: "I have given it a good test, have used all of the two bottles and have almost exterminated the gophers in my 22-acre tract of alfalfa. You know how thick they can get in alfalfa that is not irrigated. Enclosed find $2.50. Send me two more bottles." If your dealer hasn't it, send $2.50 for 2 bottles (not less than two) express prepaid by us. The ingredients can't be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. Anyway send for circular with affidavit of above killing and a few of many testimonials.

Protest of Dried Fruit Producers

Growers of Apricots and Peaches from All Over the State in Arms Against the Unjust Action of the Department of Agriculture. They Maintain That the Industry is Ruined Unless Relief is Offered

THE fruit growers of this State are fully aroused to the gravity of the situation which is forced upon them by the ruling of the Department of Agriculture regarding the sulphuring of fruit. Dr. Wiley is reported to have said that dried fruit men will not be permitted to use any sulphur whatever in the curing of fruit, if he can prevent it. "You don't need it. You ought not to have any sulphur. We will show you pretty soon how to dry fruit without sulphur. We are with you. Be patient and don't kick and your industry will be bigger than ever," is a newspaper statement of his attitude.

Just Be Good and Don't Kick.

The appeal to "be patient and not kick," may give to Dr. Wiley pleasure to advise Californians, but fruit growers from one end of the State to the other who had thousands of dollars taken from heir pockets by the fearful blunder made by the epartment in springing this fight in the midst of ast season's drying campaign, are not in the rame of mind to accept his mild advice without utting up an exceedingly vigorous kick, and at he present time it appears the growers have no esire to present their kick to Dr. Wiley or the epartment of Agriculture, but to ignore the deartment entirely and present the matter to Conress where a mighty effort will be made to save he fruit drying industry, which the department, n its mistaken zeal, seems bound to destroy.

ig as Carnegie Works.

As one speaker at the recent meeting held in os Angeles to appoint delegates to the convenion held in San Francisco today said: "If we atempt to follow Dr. Wiley's steam curing sugestion it will take a steam plant as big as the arnegie steel works to properly handle the fruit n any one large apricot growing community." nother speaker, Mr. Prince of Lankershim, aid: "Taking into consideration past experinces of practical men, the cost of fuel, the great uantity to be treated and the extremely short easons in which a crop like apricots is ripened, e do not believe the steam proposition is at all racticable. Such plants could be used only a ew days in the year, and if capital could be inuced to construct such plants, the average rice of dried fruit would not justify its use. In uch a case our apricots could not be cured, and he exceedingly small proportions which the anneries could handle would be at a price such s they might choose to make. Our own comunity of Lankershim, for instance, produces about 2200 tons of apricots. This, at times, owing to low prices which canners will pay, we are compelled to dry the entire amount. This industry is yet in its infancy and will be of far larger proportion when young trees now planted are in bearing.

All in Twenty Days.

"I have known the picking season to last only 17 days, and all know from the nature of the apricot that it must be canned or dried immediately. If we allow 20 days for the picking we in our district, are obliged to handle 110 tons of fruit per day, and in case of extremely warm weather when the season is shortened to possibly one-half that time, we are simply unable, even under the old established way of drying our fruit, to handle to the best advantage the immense daily output.

"Now to imagine that Dr. Wiley or any other professor or politician can successfully invent, perfect and install in the short time before next season's crop, plants of capacity to handle the immense output of this State, which takes into consideration such a radical change in methods of handling, is too preposterous to consider for a moment. But if this were practicable or possible, the past experiences of practical men goes to prove that the cost of fuel with the interest which would accrue on such an expensive plant, would place the cost of the product beyond the purchasing power of the people who ordinarily eat dried fruit."

That the department should watch our fruit products and keep them free from poisonous compounds and of such a grade that they will command more extended sale, is conceded to be its duty, but along this line attention is called to the fact that our sulphured fruits shipped into the German markets and at first denied admittance were afterwards admitted because it was conclusively shown that they were perfectly healthful.

Possibly Our Own Fault.

Of course, it may be as Mr. Neff said at the Los Angelus meeting, that many fruits have been so improperly sulphured as to be the cause of this campaign against the industry. But granting this to be the case let the fight be made against the abuse, and not the use, of a good thing. On this point Mr. Sutherland, of Colton, read the following from a letter from a wholesale commission merchant of Chicago:

"Your representatives in Congress should be impressed with the necessity of establishing a ruling that will allow the proper use of sulphur. It has been proven that it is not only free from harmful effects, but absolutely healthy.

"The dried and canned fruit brokers meet in Cincinnati early in February, and we will try to see that concerted action is taken by that association, and we believe that you will appreciate that every one interested in the dried fruit industry should act together and quickly on this question."

From this it will be seen that California is not alone in the fight, but the growers must not for a moment allow the greater amount of the opposition of this ruling to fall into the hands of packers and shippers.

The State Board Busy.

In the call issued for the State Board meeting, the State Board says:

The California State Board of Trade regards with anxious concern the as yet unsettled and unsatisfactory status of the dried fruit sulphuring question. As at present advised from the several sources to which we have to look for information, the situation is pregnant with danger to this important industry in which a large number of fruit growers in various sections of the State have embarked their capital.

Hesitancy and delay will surely bring disaster widespread and irredeemable. Full discussion of the various phases of the question should be had at once by those primarily interested, and prompt action agreed upon and taken before it is too late to bear results for the protection of the growers during the coming season.

What the action of the convention will be today will probably be known to many readers of the Cultivator by the time this paper reaches them, but it is assumed that a strong committee will be elected to go to Washington and appeal to Congress for relief from this unjust action. It is to be hoped that success may be achieved by the committee ,and that the great injury to this industry, which was given by the department during last season, may be, in part, overcome.

Be Just.

Let us not be embittered against the department for this action. The Department is an aid to agriculture of our State, and the lack of judgment on the part of one official must not induce us to condemn unjustly. It is not cheering to fight those who should encourage our industry, but it is necessary; therefore, let us fight hard but be square.

Hundreds of Extensive Fruit Drying Fields Like This over This State Could Not Possibly Revise Methods of Drying Before the Next Crop is Ready for the Cutters, Even if Improved Methods Were Now Known to Exist.

Orange Seed Bed Stock
Both sweet and sour, the very best. Orders booked now for delivery Spring of 1908.
Southland Nurseries R. F. D. No. 1 PASADENA, CAL.
F. H. DISBROW, Proprietor Both Phones

Sour and Sweet Orange Seed Bed Plants
The Finest Lot in California
My sour orange plants are grown from seed off the wild orange trees of Florida. Trees grown on this stock are very desirable for planting in heavy soils or lands that are subject to excessive moisture or drouth. Its most valuable feature is its resistance to gum disease.
My sweet orange plants are grown from seed off very large, old Tahiti seedling trees, thus making the very best foundation to grow an orange orchard on. Don't fail to see my stock before you buy, or address

With the Citrus Growers

RED SPIDER.

THOUGH it may be anticipating somewhat to discuss this pest at the present time, yet it is certainly opportune to sound a warning against it while evidences of its work the past season are still apparent, especially on lemons.

Since early in October lemons coming to the packing-houses from certain groves have shown a decided tendency to color before coming to size, and this has followed many months on the trees and very slow development. While this has in some cases been due to certain lack of nourishment and care yet there are many more in which these have been bountifully supplied and owners have been at a loss to account for the failure of their fruit to develop properly. Ravages of red spider are very evident in many of these cases and there is also a premature shedding of leaves and lack of color which are due to the earlier attacks of this pest.

Courtesy Salt Lake Route
One of the Original Navel Trees Replanted by President Roosevelt

The enormous damage which these mites are capable of inflicting by reason of their rapid multiplication and perpetual drawing from the plant tissues of elaborated materials which should supply the fruit and foliage of the trees can only be estimated, but it is very evident to those who watch their groves during and subsequent to these attacks, who know what the trees have received and how far results fall short of normal. Besides the immediate and evident effects on fruit and foliage there is also much damage due to these little pests in the way of preventing the setting of oranges and lemons and they certainly add greatly to the volume of small fruit which drops after apparently having set by taking away nourishment which properly belongs to these. This upsetting of the normal development of the young oranges also increases the amount of so-called "off bloom."

Too often the orchardist regards them as a periodical pest, more or less natural and inevitable; a thing which will come and go again in the course of time, quietly and mysteriously. What he does overlook is the fact that they are every day destroying the effects of many pounds of fertilizer, many inches of water and many hours of cultivation and care.

Some have learned to fear the recommended application of sulphur because in a moment of desperation—or liberality—at some time in their careers they have applied an overdose of this useful remedy and burned much fruit and foliage. One-half to three-fourths of a pound per tree, preferably of flowers or sulphur, is sufficient, as it does not need to be thrown to the very tops of high trees, and this should be put on in a very fine mist. A hand blower or knapsack dust sprayer, such as is used for sulphuring vines, is very useful for this work, as it gives a finer and better distribution of material that can be given by hand and will save the eyes of the operator considerably. Of course there must be enough moisture on the trees to stick the sulphur and this may necessitate getting up very early in the morning to get the use of the night's due. It may even necessitate throwing a slight sprinkling of water over the trees with a small spray pump, but it will be found to pay big returns in either case. The sulphur need not touch each leaf, as it is the fumes and not contact that kills the mite. When the weather is warm enough to create the fumes they will rise up through the foliage and destroy the pest. If much rain occurs it will be necessary to repeat the dose. Our experts should develop some remedy which will be effective in cool weather. But do not wait for this. Put on your sulphur at the first symptoms of red spider, one day of warm weather will accomplish wonders.—B. J. Jones.

Shipments of Japanese matting grass are now being made from the plant introduction gardens at Chico to Arizona and Texas. This plant was introduced from Japan some time ago and has increased very satisfactorily.

Cloverdale Citrus Fair people are planning for their coming annual fair. The directors elected at the recent meeting are: S. Pinchowder, W. T. Brush, C. E. Humbert, J. B. Cooley and J. J. Barnes. William T. Brush was elected president, C. E. Humbert, vice-president; George B. Baer, secretary.

MEALY BUG.

The Mealy bug seems to be causing ore of concern than in the past, and uite often an inquiry comes to the ultivator as to how to overcome e pest. We have written several garding this pest, but as yet have ut little information as to a remedy. is generally conceded that it is a fficult problem. Mr. Ehrhorn, eputy State Horticultural Commisoner, writes:

Your letter to hand and regardg the Mealy bug, will say that our partment has been looking into is matter and we have taken steps get a parasite from the tropics, hich is doing good work there. Owg to the habits of the Mealy bug, it very difficult to use sprays against the egg masses being always procted by a cottony secretion, which es not let the wash reach them. I lieve that fumigation could be used th good results, but here again the gs would be difficult to kill. If migation could be repeated after e eggs hatch the pest would practally be wiped out.

Mr. Chapman, Mr. Palmer and ners have written of limited experice, but have no definite suggesns as to effective remedies.

The treatment given in Hume's trus Fruits is only spraying which given below, but we think Mr. rhorn's suggestions better. Hume ys:

e Mealy Bug—(Dactylopius citri isso.)

The adult female is from about 4 to 0.16 of an inch (3.5mm to 4 n) in length, 0.08 of an inch in dth, and very flat. The color is ll brownish yellow, the legs and tennae agreeing with the body in or. There are seventeen appenges on each side, and most parts the body are more or less powred with particles lighter than the ound color. The egg is about .01 an inch in length, of long, ellipdal form, and light yellow color. The eggs are laid in a large cottony ss at the posterior extremity of abdomen, and require considere time to hatch. After hatching larvae exhibit a marked tendency settle along the midribs and veins the under side of the leaves or on the younger twigs, especialy in forks. Ants are very industrious nts in scattering them. The ney dew excreted by the Mealy gs forms the attraction for the s which care for them in a way t has been compared to the attion man gives to his domestic mals. Free use of carbon bi-sulde or scalding water in the nests the ants often furnishes the best ans of controlling the Mealy bug. t feeds upon house plants, citrus es, coffee, tobacco, croton, Paseo-, Solanum jasmoides and proby a number of others.

reatment: Use a powerful force ap and penetrating insecticide, h as kerosene emulsion, upon mae insects. Thoroughness and frency of application will govern the ree of success achieved in fighting insect. Repeated applications of ash, whale oil soap, one pound in or three gallons of water made le the insects are young will give st successful results. Limbs that badly infested should have the ecticide painted upon them with a sh or they may sometimes be ned out altogether.

---

eaumont is to take up the produc of Ginseng.

A MODEL PACKING HOUSE.

A Los Angeles daily gives the following:

C. E. Rumsey, owner of the Alta Cresta groves, is having constructed at the Pachappa station, known as the center of the orange growing district of Riverside, a model packing house, which, when completed, will be the finest and most up-to-date establishment of its kind in the country, and one of the show places in Southern California. Not only will this packing house have installed in it the latest and most modern appliances for the handling and packing of the orange, but the grounds adjacent to the building will be beautified and every facility will be given the visitor to watch the operations of the industry. When the building is completed it will always be open to the public.

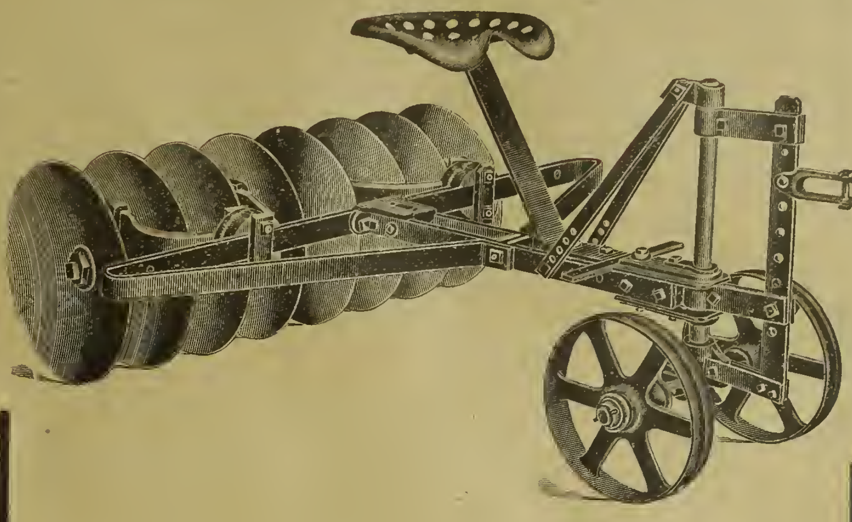
Recently a committee of citizens representing the Riverside Chamber of Commerce visited Mr. Rumsey's place, and after a conference with the owner it was practically decided that the city would assist in making the grounds more beautiful and advertise the place so that Easterners may have an opportunity of watching the interesting operations of fruit packing.

This packing house will be the pioneer in all that pertains in the handling of oranges in a scientific and painstaking manner. The fruit in the vicissitudes that attend it from the orchard to the packed box and to the car that carries it to the markets in the East, will be subject to a manner of handling entirely new. In view of the important results secured through the investigations of the United States Agricultural Department by G. Harold Powell in the matter of decay due to the faulty handling from the grove to the car, unusual precautions have been taken by Mr. Rumsey.

The system that Mr. Rumsey will install in the method of handling his fruit is interesting. He will require that every picker cuts the stem twice and wears a glove on his left hand. Each picker fills his own box and then places his card with number on it, so if there is any damage to the fruit it will be easily and quickly traced. Before the fruit is taken to the packing house it will be allowed to remain outdoors for the night in order to benefit by the cooling temperature. The roads to the packing house have been graded. This prevents the fruit from receiving any unnecessary jarring. The fruit is hauled in specially built wagons.

At the packing house an automatic dump takes the filled boxes and gently turns them over sideways, and the fruit rolls onto a canvas-covered hopper stuffed with horsehair. The fruit is then carefully inspected and graded. The packer, like the picker, is required to wear gloves in handling the fruit. In this manner the fruit is given the best handling. It means that through this careful and painstaking method a better quality of fruit will be shipped to the markets. In this manner there will be less decay, and that means a larger return, not only for the grower, but for the packer.

The advocates of the new Pomona county, to be formed of eastern Los Angeles and western San Bernardino, are making a strong campaign. One of the features was a recent tour of nearly 100 automobiles with enthusiastic promoters of the proposed county.



No. 2 Sunshine Orchard Disc Harrow

A Disc Harrow without levers, yet easily and fully adjusted.
Without pole.
Frame below tops of Discs.
Cannot injure trees or hurt your horses' necks.
Can be furnished with shield and extension irons to cultivate under the largest trees.

Because You Need The Money

It's your business and if you don't attend to it, who will? You cannot afford to keep cows for fun. That isn't business, and, furthermore, it isn't necessary. There is money in cow keeping if you go at it right, and besides there is more fun in going at it right than there is in staying wrong.

You need a Tubular Cream Separator because it will make money for you; because it saves labor; because it saves time; because it means all the difference between cow profits and cow losses.

Look into this matter; see what a Tubular will do for you and buy one because you need it.

How would you like our book "Business Dairying" and our catalog B. 260 both free. Write for them.

BUILDING UP THE HERD.

THE quickest way is by the registered sire, first breeding for quantity and then for quality, if a Holstein or Ayrshire is used. If the choice falls on a Jersey or Guernsey, first breed for richness then for quantity. This at least is the way it usually works out in a herd. The cows that make big records are not today found among the class of enormous quantity or of excessive richness. The cow that makes enough four to four and half per cent milk are the ones that are crowding the high records. Each generation, however, should be a distinct improvement over the preceding one.

Sire Cost.

The cost of a registered sire may seem great at first, but after a few calves are cows, if the selection has been wise, the money comes back quicklly. If the gain on each cow is only twenty pounds of butter fat in the year, on fifty cows that will be a thousand pounds increase. Put this at the low valuation of 25 cents per pound and the total reaches the price of the sire, with interest and cost on maintanence added, or $250. The tendency is to sell off a sire before his value is known. It is a good way to keep the original sire been satisfactory. When the cows with the first lot of cows, if he has and sire are all seven or eight years old sell them together. The next generation can be sold off at the same age. The dairyman that does best with a grade herd, works it up from common cows and after seven years sells off annually his mature cows. These cows are bought by the dairymen living near towns that cannot afford to raise the calves, yet want cows that are good milkers fully matured, to milk for five or six years.

Dual Purpose Cows.

These are hardly to be considered by the ordinary dairyman. I have not found them in breeding up from grades. They do exist, but are an accident, not a type, for they will not reproduce themselves. The calf of the dual purpose cow is always "more so;" that is, she is either more beef or more dairy than the dam. Now if the dual purpose cow is bred to a common sire the offspring becomes hopelessly mongrel. When range and ranch are combined more beef and less dairy, or more dairy and less beef in certain years, it is sometimes desirable to have Several men I know have followed this plan and found it profitable. A full blood dairy sire is kept and a full blood beef sire is also in use. The milk cows that are superior are bred to the dairy sire the rest to the beef sire. Now comes a year when more dairy heifers are needed, then more cows are bred to the dairy sire. The males are made into veal. Then comes a year when more beef is wanted, then the beef sire is used and if too many heifers are born, they are sprayed and sold as beef. The number of head of stock are kept evenly balanced in this way so that neither dairy or range is overstocked.

Dairy Steer.

We may struggle with the meat buyer all we like trying to convince him that a dairy steer is as good for beef as a beef-bred animal. I doubt if there is the difference in the beef they would have us believe. The old plea that the beef was slippery, I think can hardly be true. Along this line there is a bulletin published by the Iowa Experiment Station. It covers fully the results of feeding two groups, one of dairy and one of beef steers. Two pure bred Holstein 24 months of age, two Jersey steers 18 months old. The average weight of these steers was 574 pounds. This, it will be seen, was light for a two-year-old Holstein bull should weigh 1000 opunds; 800 would be the least weight that would be acceptable in him to a breeder. These steers were extreme dairy type doubtlesslly. Two 16-months-old Herefords and two 18-months old Angus represented the beef type.

Care.

The entire bunch were stall fed, and every ounce of food given them was weighed. Hay and green sorghum for roughage. Corn meal, bran, oil meal and gluten for grain ration. Now, for results: The beef steers weighed 675 pounds each; dairy steers 574 pounds each; beef steers' cost $47.27 and the dairy steers $45.18. The beef steers gained 606 pounds each, while the dairy steers gained 597.75 each. The daily gains for each type were, beef 1.66; dairy 1.63 pounds. Cost of gain in cents per pound were for the beef 7.81 cents, while the dairy steers made it a little cheaper 7.63 cents. The great difference now comes in the profits of selling. The beef steers brought in 4.88 cents per pound or $60.83 per steer. The dairy steers sold for 3.72 cents per pound or $42.66 per steer.

Prejudice.

While the beef steers distributed the fat more evenly than the dairy steer, the total average gain in their weight was but a trifle more. The beef steer has been bred to put the beef on the back, loins and hind quarters, while the dairy steer does not, in feeding, materially increase these parts of his body. The bulletin, however, shows that prejudice against the dairy steer is not well founded in the long run. Now the beef steers cost in dressed beef $218.95, and returns in wholesale prices were $232.61. This gives a balance of $13.66 or a net profit of $3.41 per head for the beef steers. The dairy steers sold for $170.67. The dressed beef equalled $152.29. The actual wholesale returns for the beef was $179.83. This gives a balance of net profit to the butecher of $27.54 or an average of $6.88 per head. The dairy type steer netted the butecher over 50 per cent greater profits than the beef steers. The station bulletin further says that the beef packers seem to use the existing prejudice against the dairy steers to hold down prices.

One of the interesting things I found out lately from an old meat packer, was the increasing weight of the beef steers of California. He told me that forty years ago the average weight of the steers sold to him was less than 800 pounds, now they had an average of thirteen pounds and so many were coming in that weighed

Heavy Steers

A steer receiving a small amount of Dr. Hess Stock Food twice a day in his grain will consume, digest and assimilate larger quantities of coarse fodder and make steady growth from start to finish. This is because Dr. Hess Stock Food acts upon the digestive organs, keeping them in perfect health and activity.

Dr. Hess Stock Food is the prescription of Dr. Hess (M.D., D.V.S.) and contains tonics, iron and nitrates necessary to aid digestion, make good blood and cleanse the system.

DR HESS STOCK FOOD
A TONIC

is a perfect animal tonic. It causes rapid growth, increases milk yield and insures good health and condition in all farm animals.

Sold on a written guarantee.

100 lbs. $7.00; 25 lb. pail $2.00

Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medical compound and this paper is back of the guarantee. If your dealer can't supply you, we will.

Also two thoroughbred bulls, one registered; Lawrence Burrell Kennedy Milking Machine, six machines; gasoline engine, separator, electric motor, churn, pulleys, etc.

Owner Invites Inspection Before the Sale.

TERMS: Six months' time on approved note. 5 per cent discount for cash.

FREE LUNCH.

Take Pacific Electric Cars at Sixth and Main streets, for Santa Ana. Carriages will meet all electric cars.

JAMES McFADDEN, OWNER

400, that it would only be a few years until that weight is exceeded. The values of little things is shown here clearly; I wish every dairyman would increase the milk flow of his herd in 1908 a hundred pounds a head and the butter output in proportion. The little in each cow shows up big in herd at the end of the year. "Trifles make up the sum of human hings."—M. E. Sherman.

PASPALUM AGAIN.

Regarding paspalum, about which some interest has been created by recent articles in the Cultivator, we have the following from Herbert J. Rumsey, Dundas, N. S. W.

Your favor to hand regarding paspalum grass. The introduction of this grass to our northern river districts has been so beneficial that prices of land have gone up from where it was hard to move at £2 per acre to being ready sale at £12 to £20 per acre and some farms changing hands at much higher figures than that. It depends altogether on your climate if the grass is to be the same value to you. The districts where it has been the greatest success with us have a rainfall of from 30 to 120 inches per annum and that with a high temperature. It is an essentially hot climate grass and a water grass; it will drain a moderately shallow swamp and turn it into fine pasture. If you have the temperature, as I think you have, it remains to be proved if your irrigation will equal the rainfall. It should if it will pay you to give sufficient.

Splendid hay and ensilage have been made from it, but as our people rarely go in for anything but grazing for dairying in the districts where the grass flourishes, no exhaustive experiments have been made as to its treatment under continual mowing. I have seen the oldest paddock of it which has been closely grazed for 16 or 17 years and the hundred-acre farm still supports 100 milking cows with their increase perhaps to an average of nearly twelve months before they are sold, and on this farm I saw cattle grazing in the grass which was nearly up to their backs in late autumn.

Paspalum dilltantum smothers out all inferior grasses, also those of a perhaps better feeding value; it is impossible to kill it out; it stands fairly heavy frosts, though it goes brown and is not improved by it.

Seed is generally scattered broadcast in the ashes after clearing fires or in the corn which is the first crop (in fact generally the only crop) or roots are chipped in with the hoe at intervals of about four feet leaving it to fill in the gaps by the seed which quickly matures. The grass transplants well if sufficient moisture is present, and the seed may be sown in a bed and transplanted afterwards. The seed ripens unevenly and as a result that obtainable varies very much in germinating. Cheap seed reaped and thrashed by the farmer sells at a few pence per pound, but would not germinate more than 30 per cent, while selected "first shakings" goes 80 per cent or even more; this seed is worth 2 shillings per pound.

In conclusion I would like to say the grass is of phenomenal value where it is suited, but not worth anything if conditions are unsuited, and it is only by trial that you will find out.

AN OPPORTUNITY.

Briggs & Weber, the livestock auctioneers, are about to pull off a couple of public sales of livestock which will offer an opportunity to dairymen to secure additions to the milking herd. These sales aggregate 370 dairy cows, which makes the occasion of more than ordinary importance.

The first sale is at the Watson Ranch, south of Compton, on the Long Beach line, on Jan. 22. At this sale 150 cows will be sold. These are all closely selected stock and fine milkers. In addition a number of fine horses will be offered, also implements and wagons.

On Jan. 24 the next sale it to be held at the McFadden Ranch, near Santa Ana. At this sale 220 dairy cows, milking machines, implements, etc., will be sold to the highest bidders.

Terms are offered and the man who takes advantage of these sales will find some bargains.

The horn fiy is said to be one of the worst pests that the Hawaiian Islands have to deal with. It has been on the islands for ten years and has multiplied at an extremely rapid rate.

Newbert's Phenomenal Berry

The World's Wonder

It will make you more profit to the acre than any berry that grows. $1400 actual profit has been made from one acre of this most wonderful berry. It is the largest berry that grows, a bright, rosy red and a great shipper. For pies, jams, jellies, etc., it has no equal. I grow no others. You can make no mistake by buying of me.

Deciduous Fruit Culture

VITICULTURE IN EUROPE.

IN THE Journal of Agriculture of Victoria, N. S. W., we note an extended report from a member of the experiment station force on vine cultural conditions in Europe. From it we quote:

I reached Marseilles on 22nd July, and on the following day proceeded to Montpelier, in the neighborhood of which town I spent over a fortnight visiting vineyards, nurseries, collections of vines and experimental plots. From Montpelier I proceeded via the valley of the Rhone to Switzerland where I arrived on 22nd inst., after breaking my journey at various points of viticulture interest, and also visiting Aubenas and Vallons on the Ardecre, and Vaucluse on the Sorgue, which I reached by branch lines from the Rhone. The main centers I called at on the Rhone were Avignon, Montelimar, Tain, Valense and St. Vallier; in the neighborhood of each of these towns I made numerous excursions.

Montpelier and its neighborhood presents a vast field for the study of modern viticulture and more especially of reconstitution on resistant stocks. Its vinegrowers were among the first to recognize in the use of the American vine the true solution of the Phylloxera problem. The question was studied in the most thorough manner possible both by private growers and by government institutions, cheifly the National School of Agriculture of Montpellier, which is now everywhere looked upon as the final Court of Appeal in matters viticultural. The influence of this celebrated institution is everywhere evident in the neighborhood—the enlightened vineyard proprietors of the region eagerly co-operated, assisting by every means in their power, but chiefly by the establishment of experimental plots on such a scale that the whole country practically became one vast experimental field.. The results obtained, carefuly compared and studied by the leading viticultural authorities of France, have placed matters on such a footing that growers in the district are now able to plant with certainty of satisfactory results.

The question of the use of American stocks is most complex and its study in different centers often presents strange contradictions—it is only by experimental work in each locality, extending over a series of years, that the true value of each stock, for any given locality, can be accurately determined. It is the thorough manner in which this experimental work has been carried out that has made Montpellier the center to which all countries now turn for the latest viticultural information. This result has not been achieved without frequent failures. Thousands of acres have been replanted several times over; the stocks first used proving unsatisfactory, they were replaced by others on which brighter hopes were founded. Reconstitution has been an established fact for nearly 30 years. Of the stocks first used, the vast majority are now obsolete.

Until recently, the vine was by far the most profitable culture in this part fo France. From Cette, on the west of Montpelier, to Lunel on the east, the whole country is one vast vineyard; every available acre, except a few stony outcrops, being under vines. Seen from the train, even at this dry time of the year, it presents the appearance of a sea of green, only interrupted by an occasional village, the roads, dusty and white in the strong sunlight, and the cellars, farm biuldings and dwelling houses of large estates, numerous in these parts.

Before proceeding further I must place on record the very cordial manner in which I have been received by those with whom the work of my mission has brought me in contact, without a single exception. No thought of commercial rivalry or competition has ever prevented those whom I have had the good fortune to meet, officially or privately, from doing their utmost to aid me in every way in their power.

Phylloxera.

Except in a few out of the way places, phylloxera is now seldom heard of in France. It is, of course, always there, but with practically the whole country reconstituted it is powerless to injure any but vines grafted on stocks which are not sufficiently resistant. I have seen some vineyards where phylloxera has been combated by other means than grafting, viz., plantation in sand, by submersion, and by the cultivation of direct producers. In isolated cases one or other of these may be of use with us. I have collected full information. But the true solution of the phylloxera problem is now and probably always will be grafting on resistant stocks.

Grafting on Resistant Stocks.

The only points discussed now-a-days are in connection with the choice of stock, in view of conditions of soil, climate and eion. Resistance to phylloxera is the first and most vital requirement. Many of the early stocks were wanting in this, and if not killed outright, they suffered from the insect, at least when grafted, to such an extent as to render their use unprofitable in all but a few soils unsuitable for the life of phylloxera. These stocks are now obsolete. Opinions concerning adaptation and affinity and the influence of the stock on the quality of the wine, differ greatly. The advice given in one district is sometimes quite the reverse of that to be obtained in another. This renders the greatest caution necessary.

Riparia.

This was the first pure American species used in France on a large scale. Selections were made from the wild vines shipped from the State of Missouri, U. S. A., among which Riparia Portalis or Gloire, as it is now more generally called, soon proved superoirity. It is the only Riparia now used in France on a commercial scale. Though I have not been able to learn anything very serious to the detriment of Riparia Grand Glabre, except that it is generallly held inferior to Goire, there does not seem to be much inducement for us to continue its propagation in Australia, since it has been abandoned in France. Riparia Gloire, in common with Riparias generallly, combines good qualities with some serious defects. It knits its grafts well and cuttings strike readily. Vines grafted on it commence to bear early and are remarkable for the regularity and abundance of their yield. The time of ripening of the fruit is also hastened. The defects are serious. As its name denotes it requires a free, rich, deep and well drained soil—what is known in France as Riparia soil. Planted in soils which do not suit it, it makes but litle growth and bears poor crops. It is a short-lived variety and even in suitable soil, after a few years, it loses vigor and ceases to give profitable results. I have seen blocks which, through excessive production, had become almost sterile at as early an age as seven years. In some cases vigor has been restored by exceedingly short pruning for a year or so. Large areas of Riparia on unsuitable soil have been and are now being uprooted annually and replaced by vines on more suitable stocks.

Even in suitable soil, a vineyard proprietor considers 20 to 25 years to be the life of a vineyard grafted on Riparia. In our dry Australian climate it will be well to employ Riparia with caution. Vines grafted on it must not be pruned too long or they will rapidly exhaust themselves. In the majority of cases, as is now generallly being done in France, it will be better to select other stocks in its place even in Riparia soils. In these the hybrid 3306 gives equally satisfactory results combined with greater durability. They seem to retain, in a high degree, the precious qualities of the Riparia parent without its most serious defects. A few years ago Riparia was employed in France far more extensively than any other stock; now a days, though still largely used, its popularity is distinctly declining.

Rupestris.

Of the numerous Rupestris at first selected and extensivelly propagated, only one is now in use on a large scale in France. This is the Rupestris du Lot or Rupestris Monticola, by which name, as well as several others, it is also known. The other Rupestris, such as R. Ganzin, R. Martin, R. Metallica, &c., are now looked upon as obsolete. I cannot hear of any definite charge being brought against them, but am assured on almost all sides, that they have been found inferior and discarded. I shall therefore, confine my remarks to R. du Lot.

This stock has recently given rise to more discussion than perhaps any other, and even now it is impossible to accurately judge its true value. Owing to its extraordinary vigor it has many friends and has been planted very extensively. Some growers who have cultivated it for years prefer it to all other stocks and use it for new plantations, and for replacing faulty or dying vines in their vineyards. Others give it a bad name, saying that it fears drought more than Riparia, and that it is much given to set badly the fruit of vines grafted on it. Some again, amongst whom I may mention no less an authority than M. Couderc, question its resistance to phylloxera. I have seen cases of vines affected in his vineyards near Aubenas.

In the Montpellier district this stock is very highly thought of and largely used. In the majority of cases it is preferred to other stocks in all soils, except those which are too moist, or which contain an excess of lime. Soils containing more than 25 per cent of carbonate of lime are not suitable for this stock. I have seen R. du Lot grafted with many different cions, both in the vineyards on a very large scale, and in single rows in experimental plots, alongside of rows on other stocks. In soils which suit it, at least near Montpelier, it has always been able to hold its own. The vigor of its grafts is very fine and their fruitification very satisfactory, though, as a rule, somewhat less than that of vines on Riparia stock in their prime. As regards durability it far surpasses Riparia. Though a later importation than the last named stock, it is now being used on a large scale for a sufficient number of years to abundantly prove its value in localities for which it is suited. Near Montpellier I have not been able to find a case of insufficient resistance to phylloxera on R. du Lot.

It is, as has been said, a very vigorous stock—excess of vigor is sometimes for imperfect setting of the fruit. This is one of the chief faults found with Rupestris stock. If grafted with varieties liable to set badly, the crop is usually light, especially when the vines are young—long pruning remedies this to some extent, but as a rule, it is an unsatisfactory stock for shy bearing sorts. This tendency is very evident in experimental plots where rows of different stocks grafted with the same cion are to be seen growing. side by side. Take for example, Aramon on Rupertris and on Riparia. The bunches of the former are distinctly looser and more scattered than those of the latter. With such a heavy bearer as Aramon this is of little importance, the big, loose bunches borne on Rupestris yielding as much wine per vine as the more compact ones on Riparia. But with les prolific "cepages" this peculiarty must not be lost sight of; also in the case of table grapes, many of which set their fruit badly. On the other hand, certain table grapes with too compact a bunch may be improved by this tendency to scattered berries. Vines grafted on R. du Lot ripen their fruit usually a week later than the same kind on Riparia. This point should be taken into consideration when selecting stocks for table grapes.

From what I have seen near Montpelier I am convinced that in this particular locality, and grafted with the heavy bearing cepages of the region, Rupestris du Lot gives absolutely satisfactory results in the vast majority of cases. The soil about here is deep and usually gravelly or stony and easily penetrable by the roots of the vine. Where the subsoil is clayey or otherwise, impenetrable results are less satisfactory. Though growth may be sufficient, vines grafted on this stock are apt to lose the leaves near the base of the canes prematurely, thus exposing the grapes to sunburn. In such cases R. du Lot may suffer from the drought even as much as Riparia.

At Vaucluse R. du Lot is almost as popular as near Montpelier. M. Tacussel uses it as a stock for table grapes, especially for such kinds as are to close in the bunch. At Aubenas and at Vallons this stock is held in less esteem; at the latter place, it is said to suffer from drought even more than Riparia. The case of insufficient resistance to phylloxera at Aubenas has already been referred to. It occured in a block of mother vines grown for the production of grafting wood—several depressions were noticable.

On the Rhone, at the Hermitage, St. Peray, Cornas, &c., this stock is also unpopular. Syrah (our Shiraz or Red Hermitage) grafted on it takes too long to come to full bearing, and often suffers from the partial non-setting of its fruit, known in French as Millerandage. Here again I was informed that Rupestris suffered from drought more than Riparia. On the Rhone, Hybrid No. 3309 is found to be the best stock for Syrah. All new vines planted are grafted on it. R. du Lot is rather susceptible to Pourridie or root rot in soils liable to this disease.

From the above it is evident that R. du Lot is a stock which should not be too extensively planted without careful consideration. Growers must avoid being led away by its remarkable vigor (as happened frequently in France) to preferring it to other stocks which, in certain soils at least, will give better results. In soils which suit it, such as the deep soils of Montpelier, and for suitable scions, it can confidently be recommended as one of the most vigorous, most durable and generally satisfactory stocks.

THE UNEMPLOYED.

The country is approaching a crisis; if, indeed, it is not already here, when what to do with the unemployed, the workingman out a job, will be the paramount question.

There are today a million men in these United States out of work. In this number we do not count the professional tramp, nor the proverbial lazy liver, who labors only when he has to, to keep from starving, but the skilled laborer, the common laborer who desires to be employed as a matter of choice and of education.

It is these people who we have an interest in and of whom the public must think, for it is these we owe consideration and should provide for.

In a country like this, where prosperity abounds, there ought never to be a time when a man who wants work can not obtain it. Usually there is work for every man who wants to labor, but in times of industrial depression the opportunity is not present and the honest man is left to shift for himself. It is just such an occasion the country ought to provide for.

The question comes then, how shall this be done?

We answer, in times of great industrial prosperity, when the country is flush in commercial expanse, by a system of appropriation create a public fund, in every State, to be used in times of depression in making public roads and building bridges. Our public highways are the arteries of commerce. Upon these depend the farmer and the business man. Without good roads the farmer is compelled to add at least 25 cents a ton to every ton of produce he hauls to market. The loss of time, wear and tear of horses, harness and vehicle, make up this loss. What are a few cents on the dollar added to his taxes, if thereby he saves 25 cents a ton on every ton he hauls to market? He makes the extra tax on every load he hauls.

Then, too, with labor employed, he finds a higher market for his produce, for people who have no money can not buy provisions as they would do were they at work. The man who works is the man who eats, and with labor active the produce market is always good.

Our idea is that every State should have an industrial fund, controlled by a State officer, a fund accumulated far in advance of its immediate needs, created by a small tax annually levied through years of prosperity, to be available in hard times. This fund should be judiciously expended on the roads, on bridges and culverts, until each State has a system of highways complete and serviceable for all purposes of public use.

With such a provision every man can be provided with work. None need be idle. In times of financial stringency and industrial stagnation, the State will be able to take care of its unemployed until the hard times pass and prosperity comes. We have reached a point where we must consider the needs of the million people without work. This million may grow to another million for aught we know, and it is cheaper and better to prepare for industrial aid in time of plenty than to be compelled to create standing armies to suppress revolution caused by hunger-crazed mobs in time of famine.

Truly we are on the threshold of a new condition as it relates to honest American laborers and it is the part of wisdom to provide for the future if peace is to be maintained in the country.

OUR INDUSTRIAL PROGRESS.

Statistics are far enough compiled now to give us a definite idea of the marvelous advancement the United States has made along the line of agricultural development in the year just closed. Notwithstanding the inconvenience sustained during the last two months of 1907, by the financial stringency, the figures do not show that the country has been very seriously affected, nor that the fundamental conditions on which the prosperity of the nation is based have been materially changed .

This financial crisis is merely a temporary condition which will pass away with the annual adjustment of business affairs. It will not lessen the increase of our population, which is now averaging over 2,000,000 annually.

It will not lessen the productive possibility of the soil, but stimulate it to a degree, as the trend of men is from the cities, now, toward the country. There will be a much greater per cent. of increased farming owing to the late business disturbance.

The only effect we may notice, for a time, will be the temporary halt in consumption requirement. There will be no permanent diminishing of our growth, only a resting spell, of brief period, after which we shall forge ahead with a prosperity far more marked, in the next ten years, than we have witnessed in the ten years preceding.

In all the development of our country there is nothing more remarkable than the advance in the prosperity of our farmers. Nothing more strikingly tells the story of national upbuilding than the statistics of what the farmers have wrought and of their progress in wealth. The value of all farm property in the United States in 1907 is given at $7,400,000,000, a growth of $650,000,000 over 1906.

The reports of the Department of Agriculture show that the increase in the value of farm property between 1900 and 1906 amounted to nearly $8,000,000,000, or but little less than 10 times the aggregate capital of all the national banks in the United States, finds its explanation in the value of farm products. Beginning with the census year of 1870, we have the following, quotes the Manufacturers' Record:

Value of Farm Products.

1870	$1,958,000,000
1880	2,212,000,000
1890	2,466,000,000
1900	4,717,000,000
1905	6,415,000,000
1906	6,750,000,000
1907	7,400,000,000

Taking the figures given by the sam authori we find between 1870 and 1907 the va[illegible] fa products has risen from less than $2,000,000,0 to $7,400,000,000, the value in the latter year l ing three and a-half times as great as that in t former, although during the same time the nu ber of people engaged in agriculture has not qu doubled. The total number engaged in agric ture in 1870 was 5,992,000, and the total numb at present is 11,500,000. This remarkable chan is shown in the fact that the value of agricultu products per capita for all engaged in agricultu which was $286 in 1880, has been steadily risi until in 1907 it is over $600 per capita.

In the development of manufacturing we ha seen an increase commensurate with the progr in agriculture. The value of all manufactu products, which in 1870 was $4,232,000,000, is n running at the rate of over $17,000,000,000 a ye the aggregate of manufacturing products and m eral output being nearly $19,000,000,000. Added the $7,400,000,000 of agriculture, this gives us total of agriculture, minerals and manufactu of considerably over $26,000,000,000, against $ 000,000,000 in 1900 and $12,400,000,000 in 1890.

These facts and figures, which tell someth of the foundation for future advancement in way of natural resources and geographical lo tion and something of the progress which been made in agriculture and manufactu should give us some conception of the marvel position which this country is to hold in world's trade and commerce. They also teach that we can have nothing to fear from tempor panics, as our resources are so stupendous t we can readily recover from any backsets cau by shortlived derangement of business conditio The progress of the last quarter of a cent is merely the beginning of our real broad natio advancement. What we have wrought in t period will be doubled, and in many things q rupled, during the next 25 years.

Shop Talk

DATE OF EXPIRATION. There is occas ally some misunderstanding about the date which subscriptions expire, and to make our sy tem plain to everybody, we wish to say that t date to which your paper is paid is shown on eve paper you receive. You will find it represent by the figures on the address label, and we wa to make it plain to everyone, the meaning of th figures showing this date. The first figure re resents the number of the month to which yo are paid, and the second figure the year; for i stance, 2-08 means February 1, 1908.

By noticing this label you can tell when yo time is out and when to renew. Our old subscri ers know our custom of continuing the pap after expiration, because most of our readers d sire that they miss no numbers which might bre the file they are keeping.

The subscription is supposed to be paid in a vance, though it is not insisted upon if it is convenient to do so.

After remitting or paying an agent, it is alw well to notice that the date on your paper h been properly changed, and if this is not do within three weeks, we wish you would drop us card notifying us of the fact.

AGENTS. A short time ago we stated thro this column that most of our traveling age had been withdrawn. We did not say that we h abandoned entirely this method of making collections, and in some sections we still h some agents at work. We will say, however, th any who may call upon you will be able to sh his authority to represent us.

Will also add that in those sections where agent is not working, or is not soon to wo we will mail notices from this office, and you w understand that you must remit direct to [illegible]

We think it well to make this announceme so all will understand that if you receive no n tice you may expect an agent to make collectio before very long.

HOG QUESTIONS. The book containing 5 answers to hog questions which we have adv tised in the two previous issues, as a premiu with the **CULTIVATOR**, it must be understo is sent only to those who pay an entire year i advance, and to those only who send their sub scriptions to this office.

We wish also to say that they are not se[illegible] Los Angeles, but will be mailed from [illegible] lishers in the East. By this, those wh[illegible] placed an order will understand the rea[illegible] for any delay and wait patiently.

The Gridley farmer is ridding his barns of rats by the use of ferrets.

There are nearly 2600 acres of bearing grape vines in Sutter county.

The season's rainfall at Colusa totals 3.85. The same date last year was 5.01.

Stockton grain men report the business of grain buying very dull this season.

The State Veterinian is engaged in making a number of tuberculin tests near Vallejo.

The rainfall at Yuba city to date amounts to 5.05 or less than half of that of last year.

Sutter County Farmer says that the cheapest and best proposition in Sutter county now is land.

The great quantity of snow near Nevada City insures irrigation water for many of the lower orchards.

Gridley is promised a rural free delivery. The route to be 21 miles in length and to serve 121 families.

There are two corps of surveyors and sixty men with teams working on the big irrigating lateral near Willows.

Property owners in Butte county are petitioning the Board of Supervisors for the formation of a drainage district.

The central creamery of Humboldt county proposes to go after government orders for butter the coming year.

The Gridley Herald mentions that Mr. Hunter at that place made $500 from one-third of an acre of strawberries.

The Placer Fair and Improvement Company has been incorporated for the purpose of holding fairs at the Auburn race track.

The first rise in the Sacramento river recently caused the breaking of a levee in Colusa county which started from a gopher hole.

The date set for the citrus fair at Cloverdale is February 17th to 22d. Committees are now at work and planning for a big fair.

State Horticultural Commissioner Jeffrey is distributing maps showing locations of peach diseases in various eastern sections.

The plant introduction garden at Chico is still distributing roots of the new Japanese matting grass propagated there during the last year.

Turkey thieves are making a raid on the roosts near Woodland and the poultry people are declaring that some of these days the thief will get his, all right.

A Fair Oaks fruit company reports the output of that section will be much greater than heretofore. Already 60 carloads of oranges have been shipped from that section this year.

Corning irrigators held a meeting recently at that city and appointed a committee to draft rules and by-laws for a permanent organization looking towards securing government aid for irrigation of that section.

The Sonoma County Co-operative Poultry Association held a meeting at Santa Rosa last week to receive bids for its eggs for the coming year. All bids were rejected because they were not satisfactory to the members.

Central California

A farmers' institute will be held at Kerman, January 29th.

Since October 26th Lindsay has shipped 840 cars of oranges.

The county division fight between Kings and Fresno is becoming more bitter.

The Turlock Journal says that dairy cows in that section average $12 per month.

The citrus district of Tulare county embraces 9,000 acres along the foothills.

Extensive plantings of Eucalyptus trees was made in the San Joaquin valley this spring.

Tulare county will receive about two and a half millions from her citrus crop this year.

Large tract of land is to be colonized and settled near Bakersfield known as the Kern delta land.

Kings County Fair Association held a fine fair this fall and ended the season with $85 in the treasury.

The shipment of Nebraska peach trees to Kingsburg is to be returned because of shipper failing to file bond.

State meeting of deciduous fruit men called by the California State Board of Trade is being held today in San Francisco.

Dinuba claims to have a melon vine which the past season bore 132 melons averaging 25 pounds to the melon.

Selma fruit growers held a meeting last Saturday electing delegates to the dried fruit men's convention in San Francisco.

Supervisor Forstenson of the National Forest at Arroyo Seco, near Salinas, has many men building trails and fire breaks.

The Horticultural Commission of Kings county is holding a shipment of fruit trees at Hanford which were shipped in from Nebraska, refusing to delivery until a bond is put up by the shipper.

The Turlock Journal is appealing for more extensive growing of vegetables in that section. With its water system, excellent soil and nearness to a great market it should be profitable.

An advance in the quotations on raisins is anticipated soon as the outlook in the East is very favorable. The Fresno Republican estimates that there are not more than 12,000 or 15.000 tons left in growers' hands.

The Kings County Agricultural Association held its annual meeting recently in Hanford and closed the business for the year and elected the following directors: President, George A. Dodge; First Vice-President, A. C. Bourges; Second Vice-President, Joe D. Biddle; Third Vice-President, M. P. Costa; Secretary, M. P. Avilla; Treasurer, A. F. Nunes.

The Horticultural Commission of Kings County called a meeting last week at Hanford at which about 100 fruit growers were present. Resolutions condemning the recent ruling of the Department of Agriculture, were adopted and the following delegates were elected to the San Francisco meeting: W. H. Brailsford, A. V. Taylor, Robert Kimble, C. M. Blowers, A. C. Eccles, Mark Bassett, A. M. Stone.

Southern California

Last week's light rain did much good to grain and hay crops.

Ventura county will ship nearly $2,000,000 worth of lima beans.

A pickle factory with a capacity of 500 barrels is to be a new feature at Huntington beach.

Highlands fruit growers are getting together to construct an extensive storm water drain.

And now a Santa Ana orange grower maintains that hydrocyanic acid gas is injurious to orange trees.

Imperial county, which has never had telephone connections with the outside world, hopes to be on talking terms with Los Angeles soon.

The Department is to establish a weather station near the Salton sea to make observations as to the effect of that body of water on the climate.

The new packing-house and pre-cooling plant of the Pomona Fruit Growers' Exchange will be completed in about a month. It will cost about $14.000.

Southern California fruit growers met in the Chamber of Commerce last Tuesday and elected delegates to the dried fruit men's convention at San Francisco.

A suit is now between the Rialto Orange Company and the Citrus Union for fruit destroyed in the Citrus Union Packing house fire some months ago.

Paspalum grass which has been found so successful in dairy sections in Australia has been found growing wild along the Colorado river, near the Mexican line.

B. A. Woodford, general manager of the California Fruit Growers' Exchange, estimates that the citrus output of the State this year will exceed 30,000 carloads.

Several varieties of South American grass have been introduced and are being grown in Imperial valley which are said to do exceedingly well on overflowed land.

It is predicted that in five years the fire breaks of the San Bernardino Forest Reserve will be in such a condition that an extensive fire will be an impossibility.

Members of the Brawley Cantaloupe Growers' Association have signed a contract for next year, and it now appears that the total acreage will be about 1300 acres.

Orange pickers of the Santiago Association of Santa Ana who were paid $1.75 for nine hours work went on a strike demanding $2.00. They were let out and new people put on.

The Hosp Eucalyptus Company has been organized to grow nursery stock, also to put out large tracts of land to Eucalyptus timber. The nurseries will be located in San Diego county.

The new nurseries at Lytle Creek where the government will grow young trees for forest planting has 20 acres of fine land in its new location which will be covered with fine seedlings.

The California Vegetable Union has filed suit in the Supreme Court of Los Angeles against the California Celery Union to compel the latter to cease from using the word "Union" in its name.

The Coast

There are over 400 acres of oranges planted in Arizona.

Hood River apples have been shipped to Siberia this season.

Oregon's dairy output during the past year netted to that State $17,000,000.

Water has been secured to irrigate 75,000 acres in Lincoln county, Washington.

Half a million dollars is to be expended on the Klamath-Oregon irrigation project.

Over 9000 cars of apples were shipped out of the State of Washington this last season.

A short course at the Colorado Agricultural College runs from January 13th to 18th.

The Farmers' Educational & Co-operative Union has been formed at Pullman, Washington.

A total of 363,000 acres of land formerly untillable was reclaimed in the State of Washington this year.

The products of the orchards near Spokane, Washington, brought to that section nearly $3000 the past season.

A thousand cocoanut palm plants were recently received and planted on the island of Oahu, Hawaiian Islands.

Farmers at Mollala, Oregon, are about to establish a co-operative milk condensary, capital stock at $25,000.

A series of farmers' institutes is to be held in the counties of Klickitat, Kittitas, Yakima and Benton in Washington.

Two steers, one two years old and the other one year, sold in Pullman, Washington, for the neat sum of $200 recently.

A hundred thousand bushels of wheat is stored along the river near Pullman, Washington, waiting shipping facilities.

The Orange Growers' Association of Arizona claim that the returns for their dairy holiday fruit netted the growers over $1000 per car.

The Washington State Live Stock Association is holding meetings in every county in the State to organize auxilaries to the State organization.

There has been shipped from Arizona to the East so far this season, 92 cars of Washington navels as against 18 cars last season same date.

The 44th annual National Wool Growers' Association Convention is in session at Helena, Montana. It is estimated that 2000 wool growers are present.

The condensed milk factory of the Utah Consolidated Milk Company has recently been established at Fairview, Utah. The plant will cost about $60,000.

Arizona has a number of Indians who are raising stock and making money, apparently as easy as white men. One Indian near Tucson is said to be worth $75,000.

At a two days' session of a Farmers' Institute at Davenport, Washington, special attention was given to dairying, and scholars from the High School were in attendance.

THE TORRENT.

And oft both path and hill are torn,
While wintry torrents down are borne,
And heap upon the cumbered land
A wreck of gravel, rock and sand.

ANTIQUITY OF AMERICAN IRRIGATION.

AMERICAN irrigation was old when Rome was in the glory of its youth says a writer in the National Geographic magazine. The ancient aqueducts and subterranean canals of South America, extending for thousands of miles, once supplied great cities and irrigated immense areas. Centuries before the venturesome Norseman landed upon the bleak and inhospitable shores of New England a large population dwelt in the hot valleys of our far southwest. From the solid rock, with primitive tools of stone, they cut ditches and hewed the blocks for many-chambered palaces, which they erected in the desert or on the limestone ledges of deep river canyons.

These voiceless ruins, older than the memory of many centuries, tell the story of a thrifty, home-loving and semi-cultured people, concerning whose fate history brings us no word. In these palaces and in many miles of canals we may almost read the story of another Egypt—a people toiling under the burning sun of the desert, wearily and painfully executing the commands of an American Pharaoh.

Coming down to a period less remote and only slightly less interesting, we mark the third page of our own written history. Here, in the sixteenth century, Coronado, the first great American explorer, swept up the Rio Grande valley and journeyed as far north as Kansas. In New Mexico he found a pastoral race dwelling in pueblos and practicing the gentle art of irrigation as had their forefathers, perhaps as far back as in the days of Abraham. Certainly their agricultural methods were in no wise different from those which prevailed in the days of the prophets. Even unto this day their grain is gathered in great willow baskets, is threshed by the trampling of sheep and goats and winnowed by the winds. Fields which were cultivated three centuries ago are still producing crops each year.

Some of these thoughts came to the government engineers as they ran their lines of levels in the valley of Salt river in Arizona, and it seemed to them a proper task for the greatest nation on earth to restore on more the oases of verdure which t desert had long ago obliterated.

During the last quarter of a ce tury a crop producing area of 10,00 000 acres, or another State of Mass chusetts, has been wrested from t desert. Irrigation canals lon enough to span the earth twice, a representing an outlay of $90,000,0 have been built. Every year th area returns a harvest valued at mo than $150,000,000 and 2,000,000 peop dwell in prosperity and contentme where only a short time ago t wilderness reigned.

Uncle Sam is today the large owner of the great American deser no doubt because it was not co sidered worth stealing. For man years the sentiment has been growing that the government should mak habitable this vast empire which is s great potentially.

THE WASTE IN IRRIGATION.

The quantity of water which plant use forms but a small part of tha which is diverted from streams fo irrigation purposes. Large volume are lost by absorption and seepage i the earthern channels of canal systems. Similar losses occur in th laterals which supply our farms an a large part of the remainder i wasted in irrigating crops. An irrigator is chiefly concerned in lessening the waste of water in his suppl ditch and on his farm. In localitie where water is scarce, the suppl ditch should be made water-tight This may be done by lining the channel with cement concrete, cemen plaster, asphalt, heavy crude oil o clay puddle. Flumes or pipes ma also be used as a substitute for a earthen ditch.

One of the most common sources o loss of water is poor preparation o the surface. When the soil is irrigated by flooding from field laterals an uneven surface causes needless waste of water, extra labor in spreading it over the surface and smaller fields. The water flows into the low places, which receive too much and may become water-logged, while the high places are left witout water and the crop thereon is dwarfed. The surface between field laterals should be so evenly graded that water will flow in a thin sheet over the entire surface, the excess being caught up by the lower lateral.

Another common cause of waste i the lack of attendance. Water is often turned on a part of a field and permitted to run without attention for hours and even days. On some farms the irrigators look after the water for ten hours and turn it loose for the remainder of the day. Under this practice the low places receive too much, the high places little or none, and a large part flows off the field to the injury of the roads and adjoining farms.

Too shallow and too frequent irrigation is another source of waste. Wetting the surface and neglecting to cultivate it afterwards may result in the loss by evaporation of three-fourths of the water applied in this way. For most plants, and for all deep-rooted plants in particular, the ground should be so prepared that water will readily percolate to a considerable depth beneath the surface and enough water should be applied to moisten the subsoil. As we have said again and again in farming by irrigation, thorough and frequent cultivation is of first importance. It not only prevents the escape of large quantities of soil moisture into the air in the form of vapor, but it greatly improves the condition of the soil.—Field and Farm.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

SOUTHERN CALIFORNIA POULTRY BREEDERS' SHOW.

THE annual show of the Poultry Breeders' Society was held at Chutes Park, January 6 to 12.

The officers of this association had done a great deal of hard work and were determined to make this the "best show ever" and have been repaid for their efforts. They have pulled off a show that is larger than last year, and have perhaps the largest list of individual exhibitors of any show to date in this end of the State.

This is the second show in Los Angeles this winter and we do not believe there is another town on the coast that could pull off two shows in one season, let alone two which are as large as the two held in this city.

The Score Card.

This show was a score card affair, which is considered by many to be more of an educational feature than is the comparison.

Personally, we are not a believer in score card shows; they will do all right for small shows, but when it comes to judging a show the size of this by card there are always disappointments, as it was Thursday before all ribbons were up.

Big Bunch of Leghorns.

One thing very noticable was an extra large entry of White Leghorns, which was larger than has been made for four years. We are glad to see this, as the White Leghorns have always been considered California's favorite fowl and we hope their admirers will see that they are given the prominence due them.

The pavilion at the Chutes is an ideal place for holding a show; in fact, it is the only place in Los Angeles large enough to accomodate the show.

In all, there were about fifty cups given and many of them were won by the "city lotter," which will have a tendency to encourage the beginner and small breeder.

Some Hard Work.

Dr. Winslow, of Monrovia, deserves a great deal of credit for the time he devoted, and hard work he did, and it is largely due to his efforts that the show was a success. Superintendent Andrews certainly knows the ins and outs of cooping a show, and seems to enjoy his work as well as he does explaining the good points in his Partridge Wyandottes.

The judging was done by Judges Harrison, Gunston, Matheson, Ironmonger and Goodacre, and certainly they earned their money. There were many new exhibitors on the list this year, yet many of the old campaigners were to be seen in the alleys telling why their particular breed or variety is the best and only on the list.

The highest scoring class in the show was the Buff Wyandottes reaching the exceedingly high score of 96½ points.

The weather was fine and attendance good.

Below we give the correct number in each class according to the count of Supt. Andrews:

Barred Rocks, 91; Partridge, 1; White Rocks, 84; Blk. Cochin, 3; White Cochin, 3; Buff Rocks, 12; Columbian Rocks, 1; Silver Wyandottes, 15; S. Laced Wyandottes, 15; Golden Wyandottes, 21; White Wyandottes, 46; Buff Wyandottes, 38; Partridge Wyandottes, 33; Columbian Wyandottes, 62; Silver Wyandottes, 15; S. C. R. I. Reds, 88; Rose C. R. I. Reds, 13; S. C. Brown Leghorn, 33; S. C. White Leghorn, 46; S. C. Buff Leghorns, 21; R. C. Buff Leghorn, 9; Silver Duckwing, 1; S. C. Blk. Minorcas, 45; R. C. B. Minorcas, 23; Light Brahmas, 20; Blk. Langshans, 23; White Langshans, 5; Red Caps, 6; Buff Orpingtons, 49; Blk. Orpington, 41; Jubilee Orpington, 3; S. C. White Orpington, 7; R. C. W. Orpington, 9; White Crest Blk Polish, 6; Golden Bearded Polish, 11; S. Spangled Hamburgs, 15; Houdans 12; Cornish, 31; Blue Andalusians, 20; Frizzles, 2; Cecilian, 2; Display pens, 81; White Cochin Bantams, 9; R. C. Brown Leghorn, 1; Blk. Leghorns Bants, 3; Bluettes, 2; Philippino Bants, 4; Blk. Tailed Japs, 17; Partridge Wyandotte Bants, 2; Silver Duckwing Bant, 2; Buff Cochin Bant, 27; B. B. Red Game Bants, 11; P. Cochin Bants, 15; Blue Yokohama Bants, 3; G. Seabright Bants, 4; Blue Andalusians Bants, 1; Silkies, 2. Birds removed during the show, 8; making a total of 1158.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Starbuck's Barred Plymouth Rocks
We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are layingfine. We have divided into pens according tot the way they are showing up in five months laying. $2.00 for 13 eggs from firs pen. $1.00 from 2nd. until they have time to make longer records. (Except from one best, $30 for 13. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors. Wm. Starbuck & Son. Fullerton

"Queen" Incubators and Brooders
Why pay a big price for an Incubator when you can buy a "Queen" 110-egg size for $11.00 freight paid. There are nearly 80,000 "Queen" Incubators in use giving satisfaction. Every one sold with a 5-year guarantee. It will pay you to see this machine or get catalogue and prices before you buy an Incubator.

The Vegetable Garden

SPARE THE MOLE.

We talk much about our bird friends and wish them protected, but we often neglect or kill our animal friends. Among these, by far the best, is the mole. The white grub is one of the most expensive and destructive pests we have, and unless their number can be reduced, they threaten to take the earth. They are the progeny of the June bug, which comes thumping against your windows on summer evenings. They will take possession of a piece of ground and destroy everything on it. Sometimes large patches of corn, in the richest grounds will be destroyed. They will often infest sod grounds and lawns. You have seen grass lands where the hogs were turned in and they ripped up the sod like torn blankets to get the grubs which they destroyed by the thousands. Sometimes they get into the nurseries and they never stop to count the cost, but destroy plants by the thousands. One year they killed a thousand dollars worth of evergreens for me and every year they inflict more or less damage.

Now, I am ambitious to have one of the finest collections of perennials of the country. I raise thousands of phloxes and am engaged in raising new varieties which are the joy of my life. I noticed that some of my choicest ones are being killed by grubs. It is next to impossible to dig them out. They would take a row of the best, where the plants were 50 cents apiece, and when they killed one, a sort of instinct told them to keep right on in the same row and so plant after plant was destroyed. Presently I noticed those little ridges thrown up which indicated the presence of moles and I said, "Now the avenger has come." You could see how they zigzagged around and caught the destroyers. It is supposed that moles eat the roots of plants. No, they are after the grubs and worms. They do not eat the roots at all, but they are after the rascals that do, and they do love the white grubs. When I came to dig the phloxes, I found grubs in the rows where they had made their blind furrows. A friend called on me while I was digging. He saw a mole at work. "Here, quick, dig him out and kill him." He had the prevailing spirit which says, "Kill him, kill him"—the spirit which invents mole traps. I said, "No, that little fellow is one of my best friends. He is worth a five-dollar bill." Complaint is made against him that he ridges up the lawns and destroys young plants, but he never goes where there are no worms or grubs. First, he prefers white grubs, and next he takes the angle worms.

Now naturalists may say what they will regarding the angle worm and how much good he does in passing great volumes of earth through his maw, but in the Nebraska prairie he is one of the worst pests. Our soil is generally light and friable and after he has worked in it a while it becomes like tough and hard adobe. When dry, your hoe will ring on it as if you were striking a brick bat. Such land dries out very rapidly and its value is reduced one-half. Whatever good he may do to other soils please keep him out of ours and when we see the moles after him, I say, "Sic 'em!" Sometimes moles will damage young plants by lifting them up so they dry out, but it does not take long to follow the ridges and tread them down.

In digging the phloxes, I could not see that they injured the roots any. I noticed several places where the grubs have begun to work and I was fearful of their depredations next year, but lately I see ridges which show that their enemy is on their track and they will clear the ground so that it will be safe to plant in the spring. What birds are above the ground to the insect pests, the mole is to the hidden enemies in the earth. C. C. Harrison, Superintendent Nebraska Experiment Station, York, Neb.

FARMERS LEARNING TO UNITE.

Farmers are learning to unite. In this united effort there will necessarily be more or less failures. They may try to unite on too many things at once. They may try to unite on too big a project. They may have to learn more about union of effort before they make a complete success of it. The spirit of union and of combination is abroad throughout the country districts as well as in the financial centers.

Successful dairymen, successful poultry raisers, successful beekeepers, all will tell the beginner that it is safest and best for him to begin in a small way, to grow up with the business. The same principle may be found profitable in the matter of united effort among farmers. When half a dozen fruit growers have learned to work together harmoniously and successfully in marketing their products, they have laid the surest foundation for a larger organization. During the humbled beginnings of united effort they are learning how to surrender some of their opinions to the common judgment, how to convince others or to be willing to be convinced by others.

Not only this, but during these days of smaller affairs they are finding out who among themselves is best suited for leadership. More than half of the trouble with the fruit growers' associations arises from the fact of the unwise choice of a manager. They choose a man whom they think will be efficient, but he has not been tried. He may be a successful talker, but he may lack the excutive ability.

It is encouraging to see the organization of these smaller unions among the farming classes. A new item from western Washington tells of the union of small fruit growers around Montesano, the Chehalis county seat. The fruit industry is largely in its beginning in that section and these smaller growers are taking time by the forelock and preparing to dispose of their product at a remunerative price. So they have united and as a result of that union they are assured a fruit cannery. This cannery will utilize what would otherwise be wasted or sold at a loss and will make the difference between failure and success at the end of the year, provided it is well managed.

The more these smaller unions of the tillers of the soil are organized, the better it is for farmers and farming.—Spokesman Review.

The Fullerton Vegetable Union has shipped 8000 sacks of sweet potatoes this season.

The Ornamental Garden

A JAR FOR CUT FLOWERS.

There are jars and vases of all styles and at all prices, but for the money expended nothing is handsomer for cut flowers than the glass fish globes that are sold for keeping gold fish, says a writer in Country Gentleman. A very excellent globe, nine inches in diameter and of clear glass, can be bought for 80 or 90 cents. A globe filled with water reflects the light from its surface as from a prism, while the stems and leaves seem magnified and much more brilliant when seen through the shining glass. The colors of the flowers are also reflected in beautiful tints from glass and water.

While a globe with thin glass is more liable to be broken, it will give more satisfaction in clearness and brilliancy, and there is after all but little liability of breakage. When filled with water a globe is much like a solid mass, and the even pressure of the water within protects the glass even when given quite a hard knock.

It is possible to use the fish globe for its original purpose and still have some green stuff growing in it. Two or three little gold fish (don't make the mistake of getting any above two and a half inches in length) will prove very attractive in a room, and with them can be had some pretty water plants with roots anchored in sand at the bottom of the globe. When these plants are well established they will supply sufficient oxygen to the water for the use of the fish, so that the contents of the globe need not be syphoned off more than once a week, if, indeed as often.

Whether the globe is used for flowers alone, or for plants and fish, provide a pretty little stand for it at one side of the room, and the room will have as charming a bit of furnishing as one could well wish for.

GLADIOLUS.

For early flowers, gladiolus may be planted now, but hold a quantity of bulbs for later planting, which will bloom in later summer. It is one of the most beautiful summer flowers and one easy to grow. The flowers are elegant in form and vary greatly in color. Some are white, some flesh, yellow, pink, red, dark red, etc., while others have these colors variegated. They are borne in spikes eight to ten or more inches in length, the single flowers arranged tastefully along the spike and opening gradually from the lowest to the highest. The spikes are fine for indoor decoration, keeping a long time with the stems placed in water, and if the two lower flowers are open when the spike is cut, the flowers will continue to open gradually until all are out. It may be said that only one thing is lacking—fragrance—to remind us that perfection in earthly things is by no means easily attained.

CANNAS.

This is a good time to transplant the canna roots. In fact, they may be broken apart and transplanted any season of the year, but planting now they will be in line for a fine bloom next summer.

Among our hot weather plants the canna stands unequaled, for the hotter the weather (provided it can be given a reasonable supply of moisture at the roots) the more gloriously does it flourish and the more magnificent its floral display.

Massed against a background of trees and shrubs (preferably evergreens) it makes a composition that leaves but little to be desired. It will grow and flourish with a minimum of attention. For glaring, gorgeous color its flower heads are as showy as those of any other plant grown, and for a profusion of bloom there is nothing to equal it. A single inflorescence, by actual count made last August, bore 150 flowers, and there were ten shoots to the one root. In cannas there is a wide choice, fully fifty varieties of marked distinction and a great many others which differ a little among themselves, says a writer in Garden Magazine. For instance, among the dark red flowered varieties are Beaute Poitevine and Furst Bismarck, which seem to be identical seen close at hand, but at a distance the former shows up two or three shades darker than the latter.

THE SUPPLY OF HICKORY.

On the request of the National Hickory Association, the Forest Service has taken up the commercial study of the hickory. There are nine species of hickory, the best known of which are the shellbark, the big shellbark, the pig-nut, the big-bud and the pecan. The shellbark and the pecan furnish edible nuts, while the big shellbark, the big-bud and the pig-nut produce the most valuable timber. Hickory wood is used largely for vehicles and for handles of tools.

Hickory is becoming scarce. The bulk of the remaining supply is in West Virginia, Tennessee, Arkansas, and Missouri. It is estimated that this will be exhausted in less than fifteen years. Fortunately, second growth hickory is as good as first growth, if not better. This is contrary to the usual rule of forest woods. The second growth gives an insufficient supply, being scattered, but it is worth cultivating, and this is one of the things the Forest Service investigations are to help.

For certain uses there is no known substitute for hickory, and it grows nowhere in the world but in this country. Foreign countries draw upon us largely for their carriage and handle stock.

PARCELS POST.

Inclose your money order herewith for which continue my subscription for your valuable publication. Keep the good work to the front, and don't forget to keep the parcels-post proposition before the eyes of the farmers, as it would be a blessing. I can well remember 28 years ago, the post wagons in Germany, loaded down with parcels, making their rounds. They were not one-horse wagons, but two-horse wagons, one man driving and another delivering; it was interesting to see them about Christmas time. People there don't have to go to the express office and call for their parcels, but they get them delivered to their houses, no matter where they live. If the farmer or rural dweller could only once see the convenience of it, he would soon make a demand for it. It is not only the convenience, but also the cheapness. Yours for Parcels Post, Chas. Grossholtz, Napa.

Grafting Two-Year-Old Trees.

Please state what time of year is best to graft two-year-old peach and apricot trees. Also what kind of wax to use.—Peter Mathson, Fowler.

Use cleft grafts in the spring just when the color is showing on the buds. This will be just as the sap is beginning to flow and before the bark slips. Use wax made of four parts rosin, two parts beeswax and one part tallow. Mix thoroughly by gentle boiling and stirring. Cut a scion with three buds so that one bud will be on the side of the wedge-shaped part and on the outside when placed in the split of the stump. The object is to make the inside barks come even, and the bud being situated there makes an irregular line which brings several such points together. This makes the union almost sure.

Carry along hot wax and some old cloth. Wax the stump and all cracks and wrap with strips of cloth over which place another coating of hot wax. This will seal the whole thing over and keep the air out. If you do not get a good stand of grafts, bud the sprouts in the summer, just as though they were nursery trees—J. W. M.

Grafting Orange Trees.

Please tell me when is the proper time to graft lemon on Japanese orange?—C. W., Hawards.

It is not best to graft lemon on Japanese orange at any time. If you have a choice, and your soil is sandy and well drained, bud onto sweet orange seedling. If your land is inclined to be heavy and does not drain well, bud onto Florida sour stock. If, however, you have an old tree or two that you wish to convert into lemon, bud into the old bark in the spring. Before the proper time, the Cultivator will have an article on budding over old citrus trees.

Deciduous Fruits for Market.

Which are the best apples, pears, peaches, plums and grapes for this section, for the Los Angeles market? Have both sandy and heavy black soil. Yours truly, T. H. Stafford, Los Angeles.

White Winter Pearmain and Rhode Island Greening and Jonathan for late apples, and White and Red Astrachan and Gravenstein for early kinds. Skinner's seedling is a good early sort, coming in midsummer. Plant the early kinds on the sandy soil and the late ones on the heavy land.

Bartlett, Patrick Barry and Easter Buerre pears on sandy soil. Plant Elberta, Lovell, Yellow St. John, Foster and Solway on light soil. Plant Black Farrera, Black Morocco and Flaming Tokay on light soil and Black Cornichon on the heavy soil. If Muscat does well in your vicinity, plant that on the heavy land.

Tuscan Cling is a sure bearer in Southern California, which cannot be said of any other cling so far tried. Henrietta is a very reliable yellow cling, but it does not bear as heavily as Tuscan Cling. Phillips has a very small pit and consequently gives a thick slice when canned, though it is not as large as some other clings. There is less waste and, being thick, makes an attractive article when canned. Tuscan, Muir and Phillips Cling come in the order named and do not ripen so as to interfere at harvest time. Foster, Early Crawford and Elberta ripen in the order named. Foster is a better peach than Early Crawford. Elberta is a better market peach than either. Admiral Dewey has not been extensively planted in Southern California. It is a soft peach and will not ship as well as the above named peaches.—J. W. M.

Citrus Nursery.

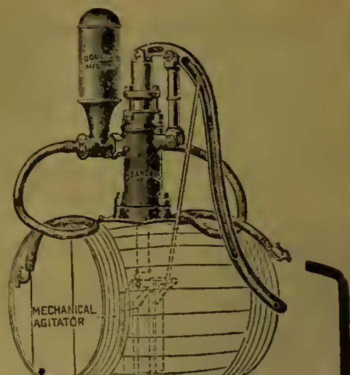
Will you please give directions, in your paper, how to start an orange nursery?—Bert Gregory, Sultana.

Plant the seed fresh from the fruit, late in May. Dig a trench about eighteen inches deep, and if the soil contains hard lumps or stones, sift them out of the soil that is to be put back into the trench.

Mix through the bottom foot of soil about one-tenth the bulk of well-rotted stable manure. This should be well mixed and no lumps should be used. Sift the manure through a coarse sieve before mixing with the soil. Make this as nearly level as can be conveniently done with a rake, settle with water, and when dry enough to rake up mealy, rake and level with a straight edge of a board. Settle again with water and fill in with about four inches of fine sandy loam. This will leave the surface of the seed bed about two inches lower than the surrounding land. This will prevent the irrigation water from running off, but provision should be made to allow for drainage during the rainy season. Irrigation water should not be used so that it will stand on the surface longer than a few minutes after applying it. It is better to apply it oftener.

Make furrows the depth of an orange seed and about four inches apart. Place the seeds in these as close as they will lie, and press with the foot so as to make them come in close contact with the soil. Cover with an inch of clean sand and keep it moist enough to prevent the sand from getting dry more than half an inch deep. This means that after the seeds have been planted in thoroughly moist soil they must be sprinkled lightly morning and evening till they begin to sprout, when once a day will be sufficient except in the case of a drying wind. A covering should be provided to keep at least half of the sunlight from shining on the plants when they are coming through the sand. Bright sun at this time is fatal. Lath placed an inch apart is the most convenient. If the plants are allowed to become accustomed to sunlight gradually after they are three inches high, they will become much stronger than when kept in partial shade all the time.

Leave the trees in the seed bed till the following May, when they should be transplanted into nursery rows, which should be four feet apart. Plant the trees a foot apart in the rows, and bud as soon as they are as large as a lead pencil. Do not cut back the seedling to the bud till the following spring, when they should be cut off about two inches above the bud. When the bud starts, rub off all the seedling buds so as to force the sap into the bud. The



Double-Acting Sprayer

With 3-inch brass-lined cylinder, brass-encased outside-packed plunger and brass valves. Large air chamber and long lever. Powerful enough for two leads of hose and four nozzles. Can be placed on end or side of barrel.

Tel. Sunset Main 3104
South Pasadena San Bernardin

Irrigation by artesian wells has developed wonderfully in the North Yakima, Washington, section, and farmers have found great increase in the possibilities in irrigated land.

buds should be forced to grow upright, and it is sometimes desirable to tie them to the stub that is left. When the buds have made a growth that enables them to be tied to a stake, use four-foot lath driven into the ground near the tree. Before doing this, stub the trees by cutting the part of the stalk that protrudes above the bud, removing them with a sloping cut. Paint the wound with some cheap mineral paint after the cut has been made a day.

If the land intended for orchard purposes can be put to profitable use, the trees may be left in the nursery till two years old, to considerable advantage. J. W. MILLS.

Seed Potatoes.

Is it advisable to plant potatoes, home grown, on the same soil? They were northern seed last spring and from them I have fall seed on hand. P. R. T., Ceres.

On general principles it is not good policy to plant potatoes, home grown, on the same soil. Yet there are very many cases where this can be done with entire success. Much depends upon the soil and the way it has been managed in the past as well as upon the condition of the potatoes to be used for seed. If the potatoes have been well ripened and seem healthy and sound and the soil is in fertile condition there would seem to be no objection to using such seed. Medium-sized tubers that fairly represent the type of the variety used, are better for planting than either very large or very small ones. And this is true, no matter where the seed is procured.

Q. A. L.

Barrenness.

I have an eighteen months old heifer, half Durham and half Jersey, well matured, healthy. Is a very quiet, gentle creature, but so far as I know, she does not want to breed. Is that natural at that age? Can you give me a remedy, etc.? C. L. A.

"Constitutional barrenness generally exists in heifers twinned with a bull calf." Improper food or want of exercise are all contributing cases. A fine heifer I owned never showed any sign of breeding until she was taken off the good alfalfa pasture and put on to a bare Bermuda pasture and let get thin, then was added to the herd with which a young bull ran. It is probably that this would bring this heifer around all right. Let her rustle for her food for five or six weeks and then see if she does not come in all right. M. E. S.

Pruning Oranges.

Please inform me where I can procure instructions for pruning citrus fruit trees.—C. L. C.

The best place always is in the orchard with a practical pruner. Other than that, and your own judgment, books and papers only can help you. Mr. Mills has, at times, had such articles in the Cultivator. "The Citrus in California" published by the State Board of Horticulture some seven or eight years ago has some suggestions, but pruning ideas have changed somewhat since then. "Citrus Fruits and Their Culture" by Hume of Florida has some good suggestions.

In a word of simple suggestions, head the tree low, clean out all dead twigs inside of tree. Remove cross limbs, subdue suckers or water sprouts and keep the tree balanced.

Peanuts.

Can you inform me through your paper as to the culture and care of peanuts? Also will they mature in sandy loam in Pajaro Valley? Or have they ever been tried here?—A Reader.

Plant peanuts in the spring about the time you would plant string beans. Plant in rows from 2½ to 3 feet wide and 1½ to 2 feet apart in the row. If the seed is good, one nut to the hill is sufficient—first breaking the shell in the middle and handle carefully. It will not be necessary to take the seed out of the broken shell. Plant about as deep as you would plant peas.

Keep the ground mellow and loose by the best cultivation, and when the plant is in full bloom cover the blossoms lightly with about an inch of soil. I have grown good crops without covering, but was careful to have the soil under the branches loose and mellow, which would allow the nuts to form under the soil. When they are dug in the fall, handle with forks so that the soil can be shaken out, then put up in small cocks and cure as you would hay. Choose the lightest and most sandy loam you can. I do not know whether they have been tried in your locality or not, but some inquiry among your neighbors might bring out that fact. I think there is no question about them maturing, if properly grown. If you should not secure the best seed, use more to the hill and they can be thinned out if too many grow.—Q. A. L.

Fruit Trees Set Square.

How far apart should fruit trees be set in order to have the trees in nice, straight rows, each and every way? —J. W. J., Curtis, Oklahoma.

If set square, that is, equal distances apart each way it is immaterial what the distance apart is, they will "lineup" nearly "every way." But if the trees, or vines, are set, say 10 feet apart in the row and rows 16 feet apart, then they will line only at right angles.

Planting From Bearing Vines.

Please tell me through the Cultivator if it pays to plant strawberries that bore fruit last summer. It is runners that were left a year ago. They did not set runners this season. —A Subscriber.

We would not plant such stock under any circumstances. We never set out plants grown from beds that have borne, much less plants that have themselves borne fruit. Strawberry growing under any conditions requires so much labor and attention that it pays to have only the very best stock that can be procured—Q. A. L.

Strawbery Tree.

I send you by today's mail a package containing sprays of two shrubs, which I wish you would tell me what they are through the columns of the Cultivator, and greatly oblige.—G. A. S., Porterville.

The one with strawberry-like fruit is Arbutus unedo, L., or the strawberry tree. This is said to be a most beautiful tree at this time of the year, with the red fruit and white flowers. It is native of the South of Ireland and the Mediterranean.

The other plant is from China, and the name will be given as soon as determined by Dr. Davidson, who identifies the above.

Feed Cutter.

Have read with a great deal of interest your article on Alfalfa in the Silo. Please kindly advise me what make of cutter and blower you are using and address of manufacturer? Would you recommend a 14-inch cutter for a small silo 12 to 14 feet in diameter, 28 feet high, silo? It is my intention to erect a silo. What makes of cutter have not proved satisfactory? A. H.

Will say that at present I am using the old outfit with an elevator and will do so until it is necessary to replace it with new machinery. In buying a cutter with blower the agent will guarantee the machinery and put it up on trial to do the work or no pay. The names of the cutters that failed I prefer not to give you, as "knocking" is a mean business. The Experiment Station at Reno, Nevada, Prof. True writes, is having perfectly satisfactory work with the Smalley outfit of cutter and blower on alfalfa.

Early Rose Seed.

Where can I buy Early Rose seed potatoes? A READER, Dinuba.

The seed men advertising in the Cultivator can supply you.

Thomas Powder.

What is the action of Thomas Phosphate Powder on orange orchard and fruit?—W. T. A., Pomona.

The action of Thomas Phosphate on orange trees and the fruit has not been fully determined. There have been cases where the effect was bad on sandy soil when applied without any green-manuring crop.

Mr. F. L. Palmer of North Pomona had experience of this nature. Thomas Powder has been used quite extensively in Riverside with green-manuring crops with apparently good results. It is a cheap form and in moist situations it has given good results.

NEW QUARTERS.

The German-American Savings Bank is sending out a little mail card folder with a view of the city of Los Angeles showing the location of the bank and many of the prominent buildings of the city. It is well worth writing for, as it is an excellent panorama half-tone view of the city.

In addition there are some convincing figures regarding the strength of this great institution. For instance, it has paid-up capital of $600,000, surplus and profits of $300,000, and with resources totaling ten millions. This institution now has over 20,000 depositors.

PILES CURED IN 6 TO 14 DAYS

Household Department

IT PAYS.

It pays to wear a smiling face,
  And laugh our troubles down,
For all our little trials wait
  Our laughter or our frown.
Beneath the magic of a smile,
  Our doubts will fade away:
As melts the snow in early spring
  Beneath the sunny ray.

It pays to help a worthy cause,
  By making it our own,
It gives the current of our lives
  A purer, nobler tone;
It pays to comfort heavy hearts
  Depressed with dull despair;
And leave in sorrow-darkened lives
  One gleam of brightness, there.

It pays to give a helping hand
  To eager, earnest youth;
To note with all their waywardness
  Their courage and their truth;
To strive with sympathy and love,
  Their confidence to win;
It pays to open wide the heart,
  And let the sunshine in.

A friendly word, a pleasant smile—
  The cost is small, indeed,
To him who gives—but priceless is
  To him who stands in need.
The human heart responds to love
  As flowers to sun and dew;
It pays to seek the needy one,
  It pays—both him and you.

A STROKE IN MECHANICAL ENGINEERING.

JOSEPH BANNON and Thomas Elrod were friends. Elrod was an educated man who never secured more than a competence. Bannon was a selfmade man, a manufacturer, and got rich. Elrod's son Henry, as a boy, had a mechanical shop in his father's cellar and showed considerable aptitude for mathematics and mechanics. When his father died, leaving him nothing, Henry persuaded Mr. Bannon to give him a subordinate position in his works. Bannon, who considered both the boy and his father impracticable, took Henry into his service under protest, remarking that the boy would never get beyond the bottom round of the ladder. Henry did well enough till his employer caught him making love to his daughter, Mary Bannon, whereupon Mr. Bannon discharged him.

The morning Henry stepped out of the office building at the factory to hunt another job he saw a group of men, foremost among whom was Bannon, looking up at the great smokestack. Joining them and inquiring what was the matter, he was informed that the stack was leaning to one side. Indeed, an engineer had just determined that at the top it was forty-five inches out of plumb.

Here was a serious matter. From all appearances a scaffolding must be erected about the stack, the stack must be taken down and another built in its place. Indeed, it would be fortunate if the chimney did not fall on the factory buildings beneath it, destroying them, with much valuable machinery. Bannon was very much troubled. His engineer told him there was no way by which the stack could be straightened, and before leaving the spot he gave orders for the erection of the scaffolding and the subsequent taking down of the chimney.

Elrod went away, trying to concentrate his mind upon getting another position. But the chimney, or rather, some method of straightening it, had got into his head, and he could not get it out. He thought all day and toward evening took pencil and paper and began to figure. At midnight he went to bed, but could not sleep, so getting up he went over his figures to see that they were correct.

The next morning, after having slept only a couple of hours, he went to the Bannon works. Carpenters were just beginning to erect the scaffolding around the stack. Henry went into Mr. Bannon's office. Bannon, supposing that he had come to protest against his dismissal, frowned.

"Mr. Bannon," he said, "I don't think it necessary to take down the stack. I have a plan for straightening it."

Bannon looked at him as a general would look at a corporal who was about to inform him how to save his army.

"If you wish it, you are welcome to it," Henry added.

Still there was no word from Bannon. He was considering whether the young man had lost his senses.

"The base of the stack," continued Henry, who gathered confidence the moment he entered upon his plan, "being square, simplifies the problem. The stack leans to the east forty-five inches. I would remove ten and a half inches of brickwork at the base on the other three sides. I would insert in the spaces left blocks of wood of equal size, thus resting the three sides of the structure on the blocks. Between the blocks I would build brick piers six inches high, leaving a space four and a half inches between the tops of the piers and the bottom of the undermined brickwork. Now, if I can reduce the height of the blocks by four and a half inches the gap will be reduced by this amount and the stack will veer to the west forty-five inches at the arc described at the top where the radius (the chimney) is 122 feet."

Bannon's eyes were fixed on the speaker during this statement with growing interest. He had forgotten the lesser in the more important matter. He continued to stare for a few moments after Henry had finished, then asked:

"With the enormous weight (nearly 400 tons) on the blocks, you can't cut them down and get out the surplus."

"I have thought of that," Henry replied. "I will burn them out."

It seemed as if 400 tons had been taken off Bannon's mind.

"Where are your figures?" he asked.

Henry produced them and waited while Bannon went over them again and again.

"Come," said the latter when he was satisfied; "you shall have charge of the work."

After the successful removal of the bricks and the insertion of the blocks Henry Elrod marked off the space to be burned out, set the blocks on fire and kept them burning evenly. If one burned faster than the others it was immediately checked till the others caught up with it. Thus they were kept burning uniformly while the stack slowly righted. Small fissures opened on the opposite side near the base, but steel wedges were driven into them, which maintained a solid mass. When evening came the work was finished and the stack was as good as when it was first built.

Henry Elrod, when at breakfast the next morning, received a note from s late employer containing a check · $1000 and offering him a position superintendent of building and ıchinery at a handsome salary. ıother note, written in a more delite hand, came with the first, conatulating the young engineer on s triumph. Henry's wife now owns e factory and Henry is its manar.—Field and Farm.

RECIPES.

vo Cheese Recipes.

Cheese on toast is a good dish for e informal little luncheon. To ıke it, use a cup of grated cheese, ʋ tablespoons of butter, eight taespoons of milk, two teaspoons of ur, a pinch of salt. Rub the flour, lt and butter together, add the lk and bring to the boil, add the eese, boil up again. Pour over ısted bread which has been slight- moistened and buttered.

gs With Cheese.

Eggs are improved served with eese for a change. Add two tableoons of butter to two-thirds of a of milk and heat. Drop the eggs o muffin rings and add the heated k and butter. Sprinkle with salt, oper and grated cheese. Brown in oven and serve.

eapple Tapioca Pudding.

One cup of tapioca, washed or ked. Cook till clear in water, to ich has been added a teaspoon of . Partly cool before adding the er ingredients. Cut up fine two s of pineapple and let it stand an ır with half a cup of sugar stirred it. Put it into the tapioca. Beat ks of two eggs with half a cup of ar and add to the pudding. Bake een minutes, or a little longer, in tered pudding dish.

eat two whites of eggs till very f, then beat in a tablespoon of eapple syrup, reserved for that pose, and two tablespoons of ar. Put over the pudding and wn a moment in oven. This is served cold.

n Meal Gems.

ft together one pint of meal, the e of flour, and two teaspoons of ing powder; make into a stiff bat- with a pint of sweet milk and egg. Bake in gem pans in a k oven.

HOMELY HINTS.

at Turpentine Will Do.

ırpentine and soap will remove spots, wheel grease and tar ns from linen or muslin.

mixture of turpentine and lin- oil will restore furniture disred with water.

oisten stove blacking with turpentine and it will not burn off as quickly.

To alleviate spasmodic croup spread lard on a cloth and sprinkle with turpentine, or mix the lard and turpentine, spread and apply to the chest.

For a cough caused by a tickling in the throat, take a little turpentine dropped on loaf sugar.

Loaf sugar and turpentine is an excellent worm remedy for children.

To cure corns, bathe persistently with turpentine. They will be less painfull and after a time will disappear.

Turpentine applied freely will alleviate the discomfort caused by bunions.

For "crick" in the back, rub with turpentine and heat it in. Some claim that it may scatter the pain, possiblly to a vital organ, but the writer has found turpentine a sovereign remedy for years.

For gapes in chickens, swab the throat with a feather dipped in turpentine.

For "foul-in-the-foot," apply turpentine with a brush or swab and keep the feet dry.

If flies have worked in sores or wounds on animals, cleanse with turpentine.

Moths will not work in a closed box or trunk where there is kept an uucorked bottle of turpentine, or if the contents are occasionally sprinkled. Turpentine is not effective in the case of "buffalo bugs;" for these pests use gasoline or benzine.

A little turpentine applied with a woolen cloth will clean gilt ornaments and gilt picture frames.

Rub tan shoes with a cloth moistened with turpentine.

After lifting a carpet add two tablespoons of turpentine to a pailful of water and mop the floor.

After laying a carpet use a mop of clean cloth wrung dry from warm water to which has been added two tablespoons of turpentine. Wipe the carpet all around the roof for six or more inches from the baseboard. This will serve to check moths.

Apply turpentine on carpets under heavy furniture not on castors or that is not easily moved.

To brighten a faded carpet sweep with a broom dipped in turpentine water, a tablespoon to half a pail of water. Shake the broom well to remove all surplus moisture. The effect is no better than with ammonia and water, but it is more lasting.

Clean oilcloth with a woolen cloth moistened with turpentine. This, as with a carpet, is preferable to ammonia only because it will not need to be so often repeated.

Thin the paint or varnish that by standing has become thick with turpentine; keep all small paint brushes when not in use in a covered paint pail in turpentine. If kept covered it will not evaporate. Will keep the brushes as pliable as gasoline.

For furniture polish, take one-third linseed oil and two-thrids turpentine; shake will, apply with a very thin cloth, and wipe with the same.

For marred furniture, take half an ounce each of turpentine and linseed oil, an ounce of coal tar and shellac. Keep in a wide-mouthed bottle tightly corked. Shake before applying with a sponge.

Ivory knife handles that have become yellow or discolored, by rubbing two or three times at intervals with turpentine, will be greatly improved.

OWED MONEY A LONG TIME.

A Richmond lawyer was consulted not long since by a colored man who complained that another negro owed him three dollars, a debt he absolutely refused to discharge. The creditor had dunned and dunned him, but all to no purpose. He had finally come to the lawyer in the hope that he could give him some good advice.

"What reason does he give for refusing to pay you?" asked the legal man.

"Why, boss," said the darkey, "he said he done owed me dat money for so long dat de interest had et it all up, an' he didn't owe me a cent."—Harper's Weekly.

DEFINITIONS OF HOME.

Home is the place everybody is glad to get back to, no matter where they have been—if their home is a happy one.

Home is the place everybody is glad to get out of; that is, if their home is an unhappy one.

Home is a place of light, inspiration, grace.

It is the holy of holies, in which a good woman ministers its religion, its sacraments and sacrifices.

It is the sanctuary in which she is the divinity, the law-giver, the confessor.

Home is an oasis in the arid plains of modern society.

"We are always in these days endeavoring to separate intellect and manual labor; we want one man to be always thinking and another to be always working, and we call one a gentleman and the other an operative; whereas the workman ought often to be thinking, and the thinker often to be working, and both should be gentlemen in the best sense."—John Ruskin.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL
For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons Exterior Cancers, Boils Corns and Bunions CAUSTIC BALSAM has no equal as a Liniment.
We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

an Francisco Markets

3an Francisco, Jan. 14th., 1908.

Butter.

Butter has refused to down and dur- g the week has recovered some of former loss. Extras have advanced cents a pound during the week. The lder weather is given credit for the crease.

The current prices on dairy pro- icts in San Francisco are always om 2 to 3 cents higher than the rates ven in the daily official list of the holesale Dairy Produce Exchange. ie retail dealers in this city invari- ly pay an additional 2 cents per und on butter and per dozen of gs, and occasionally it is 3 cents. cheese the increase is 1 cent per und. By making these additions the Dairy Exchange prices the pro- icer in the country can always de- rmine the actual prices ruling in is city. The quotations as prepared the San Francisco Wholesale Dairy xchange yesterday were as follows:

Hay.

Somers & Co. say:

Arrivals of hay for the week ending today, show a total of 3290 tons in comparison with 4040 tons for the week preceding. This lessening in shipments was very opportune for the market was becoming very badly crowded and prices were again showing a decline. With the turn of the year there has been a general improvement in business throughout the city, and it is expected that the hay market will also show beneficial results, providing, however, that discretion be used in regulating shipments here.

The interior demand is fast helping to reduce surplus stocks, and at the moment we can see nothing but a rather encouraging outlook to the situation. Much still depends on financial matters, however, for hay trade depends on all industries and will be greatly improved when the general rebuilding of the city is resumed.

Although some receivers of hay are cutting prices in order to effect ready sales, yet quotations continue along about as they have been during the past two weeks. We give them today as follows:

Alfalfa local	9.00@13.00
Tame oat choice	11.00@16.00
Wild oat	10.00@13.00
Wheat and oat	11.00@15.50

Corn small yellow	1.50@1.55
Corn large yellow	1.50@1.55
Oats white	1.60@1.70
Oats red	1.75@1.90

Feed Stuff.

Bran per ton	28.00@30.00
Straw per bale	50@85
Feed cornmeal per ton	37.00@37.50
Cracked corn per ton	37.00@38.00
Rolled barley per ton	35.00@36.00
Oil cake meal per ton	38.50@40.00
Cocoanut cake, per ton	25.00@26.00
Middlings	31.00@37.00

Citrus Market

LOS ANGELES, Jan. 15, 1908.

Oranges have gone forward in large quantities for the last few weeks, stimulated in part by the good prices prevailing. This has caused a slight weakening of the market so that present quotations are lower than a couple of weeks since. If good weather conditions continue in the East, however, it is predicted that fair prices will prevail.

Lemons are commanding a good sale at this time. The output will be large as the weather has been favorable to sizing up the small fruit. The warmer weather conditions of the East is favorable.

Shipments.

Shipments of citrus fruits to date agregate 3809, of which 690 were lemons. To same date last year, 2429 cars, of which 461 were lemons.

BOSTON, Jan. 13.—Market easier. Weather favorable. Sixteen cars sold. Four cars on track.

Beautiful Billowy Sea

Courtesy Out West Magazine

Beautiful, beautiful billowy sea,
Rolling and dancing and tumbling in glee;
Breaking in bubbles as white as the snow;
Washing to shore with thy ebb and thy flow;
Rumbling and roaring in cadence so grand;
Leaving thy footprints along the white sand;
Beautiful, billowy sea.

Beautiful, beautiful billowy sea,
Hush thy commotion and answer to me—
Who formed, who created thee, beautiful sea?
Who gave thy proud breakers their beautiful blue?
Who created thy waves with their delicate hue?
Some questions I'll ask; wilt thou answer me?
Beautiful, billowy sea.

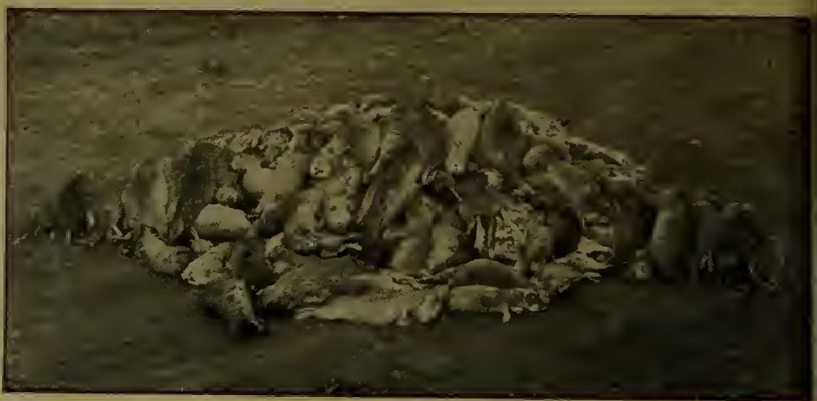
Now is the time to go for gophers with

Bille's Gopher Poison

The Gophers go for it and it will go for them good and plenty every time



This is a photo of 201 killed in one day on a ten-acre field before they could get ba
to their holes, with one bottle of BILLE'S COPHER POISON.

Endorsed by Agricultural Colleges and Experiment Stations. Has h
greatest success for years in the Middle West, and also here in California la
season. It is most attractive to gophers, squirrels, etc, and sure death
them. One among many, Amos. L. Grigsby, Campo, Cal., writes: "I ha
given it a good test, have used all of the two bottles and have almost extern
nated the gophers in my 22-acre tract of alfalfa. You know how thick th
can get in alfalfa that is not irrigated. Enclosed find $2.50. Send me tv
more bottles." If your dealer hasn't it, send $2.50 for 2 bottles (not less th
two) express prepaid by us. The ingredients can't be bought at a drug sto
for that price. Money refunded if not as represented—so printed on the bo
tle. Anyway send for circular with affidavit of above killing and a few
many testimonials.

ol. XXX—No. 4 Los Angeles, California, Thursday, January 23, 1908 Subscription $1 a Year

nvestigations of the Cabbage Aphis

Prof. C. W. Woodworth, Entomologist of the State University, Writes of His Recent Investigations in the Fullerton and Whittier Fields. This Has Been a Favorable Year for Development of the Pest

THE plant louse, now so abundant on cabbages and which has already destroyed many thousands of dollars' worth of this crop, be- ngs to a group of insects upon which so little s been written in California that very few ve a clear idea of their habits and life history. ithout attempting to treat the subject exhaus- vely or waiting till the studies now under way e brought to conclusion, we will attempt to rnish the growers information for immediate e, so that the situation may be handled as intel- gently as possible.

ne Insect.

The cabbage aphis occurs all over the world, eding exclusively on cabbage, mustard and her members of the same botannical family. t the present time it occurs in our cabbage fields seven forms. The young newly born individ- l (Form No. 1), after about a day the insect has increased in size as to render a change of skin ecessary. After this change two forms can be cognized, one ovate in shape, (Form No. 2), d another with the suggestion of a waist-like nstriction, (Form No. 3). Another day or two ill require a second change of skin. The ovate rm retains almost the same shape (Form No. , but the other is still more constricted near the iddle and possesses on each side conspicuous cket-like outgrowths on which wings are finally eveloped. (Form No. 5). The insect gains early full size before the final change of skin is ecessary, and which produces the mature insect, ither wingless (Form No. 6), or winged (Form o. 7).

reat-Grandchildren in a Week.

A plant louse thus either passes through the rms 1, 2, 4 and 6 or 1, 3, 5 and 7, according to hether the insect becomes winged or not. In ither case, the young by form 6 may become rm 7 in the next generation, or vice versa, and wo lice born the same day from the same pa- ent may either produce when full grown one of ach kind or both of the same kind. At the pres- nt time there are no male insects being pro- uced, nor any females capable of laying eggs; ndeed, such forms have never been noticed in he case of the cabbage aphis, though it has been nder observation in this country and in Europe or many years. All increase is by the birth of iving young without sexual reproduction and at rate that is almost inconceivable. A cabbage ouse of form 6 can produce several young in a ay, and in a week may sometimes see its great- randchildren. This rapid development only oc- urs in case the insect passes through the forms , 2, 4 and 6. This is the line followed when all he conditions for growth are the best. In case onditions are less favorable, some will develop hrough the series 1, 3, 5 and 7, and the winged nsect leaves the plant in search of better quar- ers. Sometimes nearly all of the insects on a plant assume this line of development, and the plant thus is almost or quite rid of the lice. The flying forms are not as prolific as the wingless mothers, but if they are fortunate in finding favorable feeding places their descendants become wingless and are soon prosperous colonies.

Checks to Increase.

Any one mathematically inclined can soon compute that plant lice could soon completely cover the earth with their progeny, but in fact they seldom or never reach a point where all the available food of the kind upon which any particular species depends has been exhausted. While a good proportion of cabbages in a field may be so stunted as to fail to produce merchantable heads, still in the worst condition some heads will be produced. This is because plant lice have natural checks limiting their increase.

Beneficial Insects.

The most conspicuous checks to the increase of plant lice are the ladybirds. The common red ladybirds are rather common in cabbage fields, and sometimes one will see a few of their larvae. In no field visited have these insects been abundant enough to eat one per cent. of the natural increase of the plant lice. Next most abundant were the larvae of Syrphus flies, footless, slug-like maggots that feed very voraciously, but are still more helplessly inadequate than the ladybirds. A third group of insects are the parasitic wasps. These are very conspicuous from the fact that when a plant louse is stung it swells up almost spherical in shape and becomes pale brown in color and clings firmly to the leaf after death; finally from these mummies a wasp issues, by cutting a round hole in the side or back. After living plant lice have disappeared from a leaf these dried remains may be all that remains of a colony and may give the impression that the colony was destroyed by the parasite. As yet no single leaf was found in which the number of parasitized lice amount to one per cent of its total number bred on the leaf. Possibly under different conditions beneficial insects would make a better showing, but they have not been an appreciable factor in the situation of our cabbage fields this season.

Contagious Diseases.

Plant lice are known to be particularly susceptible to contagious disease. These may be grouped into two classes: those produced by fungi and those due to bacteria. The former are the most evident, though perhaps the latter are the most efficient.

Fungous diseases generally result in the production of dried up mummies, often clinging to the leaf, and under proper moisture conditions becomes finally covered with a dense, mold-like coating. In some fields a greenish fungus is very common and may have been largely responsible for the disappearance of the insects from such plants.

Bacteria are minute microscopic plants and absolutely invisible to the eye. Bacterial diseases usually cause insects to become flabby, the insects losing their power of locomotion, generally fall to the ground and finally collapse and dry up. Others may be ruptured upon the leaf and their collapsed, dried bodies remain attached to the leaf. There may have been several of these diseases at work among the cabbage aphids, but it is very difficult to study and not enough work has yet been done to justify any statement regarding them, other than that in the majority of cases where there has been evidence of diminution of aphids, the diseases have not been an important factor.

Weather Conditions.

There is no doubt but that the weather is often directly responsible for the death of a great many plant lice. Severe enough frost will certainly kill them, but there has been no death in the cabbage fields this year from frosts and it is doubtful if frosts severe enough for this purpose are ever to be expected in our winter cabbage growing section. Heat also is fatal to aphids, but here again we have a factor not of local significance. Heavy rains may beat plant lice from the plant and accomplish their death, since a very small number thus detached ever get back on the plants. The rain we had a few nights ago was about as hard as we can expect and while many lice were actually destroyed, there were very few cases where those thus removed could not be replaced by the natural increase of those that remained in two or three days.

The direct action of the weather conditions is thus seen to have been a very small factor in the present situation. Indirectly the weather is probably always a most important factor. Plant lice thrive within rather narrow limits. When the weather becomes too moist the disease becomes too prevalent. The poor showing the diseases have made this season has probably been due to the lack of rain. The past experience has been that rainy spells result in a general destruction of plant lice. The supposition that the rain is directly fatal is worng, but instead, the moist conditions of the atmosphere favor the dissemination and increase the virulence of the contagious diseases. Everyone has probably noticed that while rains generally cause the destruction of the insect, in certain cases they will remain just as bad as ever; sometimes on single plants where there seems to be no reason why the weather should not have had the same effect as on surrounding plants. Since the death is due to disease, however, such cases are to be expected, due to the absence of the necessary disease germs.

Dry Weather Also a Check.

Such a dry condition as has prevailed this season presents another limit to their continued development on a plant. As long as there are only a few lice on a plant, the conditions are rather favorable to growth and the insect develops along the line indicated above as forms 1, 2, 4 and 6. After the plant becomes badly infected, if the weather is dry, we see the insects suddenly changing their mode of development to forms 1, 3, 5 and 7, and when stage seven is reached they fly off into the air. The dryer it is at this time the less the chance of one of these migrants getting back onto a cabbage plant with enough vitality remaining to enable it to leave descendants. Whole fields have in this way become almost free from lice and many plants in almost any field not too recently planted will show the curled leaves of extinct colonies. Dry weather acts thus as a check preventing excessive numbers, but not protecting the plant from injury, since winged forms are only produced after the plant is in a bad way and new colonies are established again whenever the plant makes a new start. Winged forms can be seen in the air everywhere about cabbage fields and it would be only an accident if a plant should escape being infected.

Remedies

It will be thus seen that natural checks are hardly classible among the things we can control and therefore make use of, so at times we must resort to remedies if we are to escape the destruction of the crop. Still these natural checks are usually more efficient than any practical remedy, and it is necessary to understand their nature if we would avoid the mistake of applying a remedy when not useful, or refraining from a treatment

Concluded on Page 103.

With the Citrus Growers

THEORY AND PRACTICE IN PRUNING LEMONS.

THE best pruners of lemon trees give their employers the benefit of years of observation as to the best methods of pruning and the best months in which to accomplish desired results. This does not generally refer to certain well prescribed "systems" of cutting the trees such as that ascribed to our Italian friend Baronio, for there are many tricks which the expert pruner takes advantage of according to the needs of the grove or the individual tree in hand, which are more important than these wider systems to which too close a conformity is often injurious.

As suggested, these finer but important details are the property of expert pruners and are the result of years of work and careful observation. Too often they are entirely unknown to the small grower who is new at the business and who wishes to do his own pruning. In cutting the tree he depends too much upon book knowledge of certain systems, or has constantly in mind a certain principle in regard to time or method of pruning, which may not apply to his grove at all. No one but the man who has tried appreciates how difficult it is to prune a fruit tree of any kind with ony theoretical knowledge to draw upon. It reminds one of a famous saying of Josh Billings: "It is easy to make a hornet's nest if you know how, but I'll bet you could'nt make one that would sell to a hornet at half price."

I have in mind two groves situated on opposites sides of a public highway. The soil is of the same character in each, and the trees of the same variety and age, yet one produced from twice to three times as much fruit on ten acres as the other on fifteen. Differences in cultivation, fertilization and irrigation were slight. But the owner of the fifteen acres had his pruning done in June and July. He was working on the theory that the growing water shoots extracted much nourishment that should have gone to the fruit. By clipping them at that time of the year he was not destroying them as he hoped, but forcing out from the base of each half dozen new ones, which filled the trees so completely that they were as dense as an evergreen hedge and really spent their entire energy on this vegetative growth.

Those who practice flat pruning to excess are bringing about much the same order of things and will have this difficulty always to contend with. They will learn that more and more must be added to the labor bill each year to keep the trees in shape. There is primarily a small bearing surface on such trees and a perpetual fight ensues to keep this sufficiently open to make it bear fruit. The best growers, and especially those who have the Eureka lemon, find it generally profitable to keep an open tree, not too low, into which the sun can penetrate, and which will as a result both inside and out; indeed many claim that the best grades of lemons are produced on the inside of the tree. Such a tree will not need to be "shorn" when it is pruned, and will naturally shade itself sufficinetly to protect its outside fruit from burning by the summer sun.

If "suckers" are pruned in the fall after their years' growth is nearly completed, or after they have lost much of the purplish color at the tips, they will be eliminated instea of throwing out branches. On the other hand, the top of a tree can be thickened in places desired by cutting these growing shoots earlier in the summer six inches, more or less from the base. They will then branch at the remaining leaf bud and these branches, if properly tended, will make fruiting wood to fil out the head.

This is only one of the prominen features of malpractice in pruning, and there are many others. Inexperienced owners or aspiring pruners will always find it profitable to study under an experienced hand, not a contract pruner who "cuts," but one who has a reputation to maintain and who knows at once by the appearance of the fruit and branch of each individual tree what its requirements are. Even if the owner should hire such an expert and prune the trees first under his direction, it would be cheaper than learning entirely at the expense of the grove he has recently acquired, at the risk of defeating his own ends. Such a training would also bear directly on his own property and would eliminate the possibility of a difference between its needs and those of a neighbor's grove where he could go to receive training from a pruner hired by the latter, expecting later to apply this knowledge to his own property. Contact with such an expert would soon teach him what a large influence time and method of pruning have on the productiveness of the trees and the difficulty of getting them back to normal after a series of improper or untimely treatments.
—B. J. Jones.

OAK FUNGOUS DISEASE.

This local but very destructive trouble has shown itself in a number of citrus groves, and in several of these replanting has already become necessary. The disease has been known for many years and is very damaging in many deciduous districts where the trees have been planted on land formerly occupied by oaks. The writer has seen several acres of peaches entirely killed out by it. On citrus trees it has much the same appearance, is apparently as destructive and should be readily recognized by the orchardists.

The fungus attacks trees by contact of their roots with decaying oak roots. The rot spreads rapidly among the roots and up to the trunk of the trees, stopping at the ground lino and appearing just beneath this in a rotting and disintegration of the tissues, accompanied by a white growth in the inner bark. It belongs in the toadstool group, and the fruiting stage, small toadstool formations, are rarely seen about the base of diseased trees.

It is evident that, as planted trees become older and their roots interlace, it will spread readily from one to another by contact and thus eventually cover a considerable area.

Theoretically, this disease should always be considered in planting out new groves on land occupied by oaks. No resistant roots are known and this does not appear to be a field for control as these roots are all softer and more susceptible than those of

Sour and Sweet Orange Seed Bed Plants

The Finest Lot in California

My sour orange plants are grown from seed off the wild orange trees of Florida. Trees grown on this stock are very desirable for planting in heavy soils or lands that are subject to excessive moisture or drouth. Its most valuable feature is its resistance to gum disease.

My sweet orange plants are grown from seed off very large, old Tahiti seedling trees, thus making the very best foundation to grow an orange orchard on. Don't fail to see my stock before you buy, or address

oaks, the primary hosts. The land should be allowed to stand for about two years after removing the oaks, possibly being planted to annuals of some sort, before the deep-rooting trees are put out. When the oak roots have partially decayed, after being burned out as far as possible, it is a good practice to place a large dose of carbon bisulphide in the pit so that it will penetrate into the soil along the line of the decayed roots and disinfect it thoroughly before trees are planted.

An expert from the experimental station who has had much experience with this disease in deciduous trees and vines, suggests that a pit should be dug about infected trees and a solution of copper sulphate (bluestone) one and one-half pounds to one gallon of water, poured into it. This will protect the main roots and enable them to throw out laterals to save the tree and at the same time it will cut off the connection between diseased portions and those unaffected, and thus prevent the spread of the trouble to a large extent.

If your lemons or oranges are sickly in some parts of the grove, you may discover that they are affected with this trouble and an early application of remedial measures may save many trees and prevent further spread of the disease.—B. J. Jones, San Dimas.

SAYS CYANIDE DAMAGES CITRUS TREES.

S. W. Smith, who owns a fourteen-acre orange grove, near Olive, reports to the Blade that a large percentage of his trees have been damaged by careless methods of the fumigators in dumping the residue of cyanide and sulphuric acid left in the jars after fumigating on the ground beneath the trees. Mr. Smith says his attention was recently called to the fact that several of his young orange trees that had been fumigated a couple of months ago were apparently affected with dry rot. He at once began an investigation that led to the discovery that wherever the cyanide and sulphuric acid jars had been emptied beneath the tree, that tree was more or less affected in the manner described.

Digging down to the roots of these trees, Mr. Smith found that the cyanide had penetrated through the soil and had caused the root to wither and dry up, and had also worked upward and affected the branches fed by the root that had been damaged. Out of his fourteen-acre grove Mr. Smith says he found thirty trees so affected, and as this is a pretty big percentage, he wants the result of his discovery made public, to the end that other fruit growers may profit by his experience.—Santa Ana Blade.

CUTTING ORANGES GREEN.

During the last few weeks, in fact ever since the Florida orange season opened, the strange shortsightedness of many, in fact most of the growers, has had another exhibition in the wholesale markets of Philadelphia.

Not since shipments of Florida oranges begun this season have 10 per cent of the retail grocers of the north had a thoroughly ripe orange in their stores. The fruit has mostly been such as the native Floridian would refuse to eat. Picked stark green and rushed north to get the northern money, the fruit has ripened slowly and irregularly, being usually put on sale bruised with green blotches of an exceedingly unsavory appearance. The flavor of such oranges bear no resemblance whatever to that of a properly ripened Florida orange. And that the public recognizes the difference is seen from the fact that oranges of the latter class are now eagerly wanted at $4 per box, while the green kind find it quite difficult to get from $2 to $3.

In other words, the shrewd foresight of the green orange picker has had the extremely satisfactory result of cutting his price from $1 to $2 per box for his fruit.—Grocery World.

ALASKAN YUKON EXPOSITION.

The Alaska-Yukon-Pacific Exposition will be held in Seattle, Washington, during the summer of 1909, and California is much interested in its success.

An appropriation of one hundred thousand dollars was made at the last session of the Legislature, in order that California may be properly represented at this Exposition.

The various commercial organizations of the State are already taking up the matter, and it is hoped, with the co-operation of these bodies, that all parts of California will have an opportunity to exploit their resources and to take advantage of the general appropriation made by the people of the State for such prpose.

As is well known, California formerly enjoyed the Alaskan trade, but of recent years this trade has fallen away materially, notwithstanding the fact that the business of Alaska has increased to very large proportions. As this trade with Alaska will continue to increase as the country is developed, there is an opportunity for California to benefit by it in an increased commerce with that part of the United States, without materially affecting the present trade that is now in the hands of the Seattle people. In other words, there is room for all.

The Alaska-Yukon-Pacific Exposition will give California an opportunity to properly present its vast resources and its claims to a portion of the Alaskan trade, as well as to exploit same among the vast number of strangers from all parts of the world who will visit the Exposition.

The California Promotion Committee offers to assist California's representation in every way possible, and its facilities are at the command of the people.

BUREAU OF IMMIGRATION.

The Cultivator is in receipt of a set of blanks which the Department of Commerce and Labor is sending asking assistance in the distribution of aliens who are daily landing in New York. The blanks ask many questions, to give an idea of the advantages offered to the settler. The statement accompanying the blanks says:

Authority is given the Commissioner-General of Immigration to establish, under the direction and control of the Secretary of Commerce and Labor, a division of information in the Bureau of Immigration and Naturalization; and the Secretary of Commerce and Labor shall provide such clerical assistance as may be necessary. It shall be the duty of said division to promote a beneficial distribution of aliens admitted into the United States among the several States and Territories desiring immigration. Correspondence shall be had with the proper officials of the States and Territories, and said division shall gather from all available sources useful information regarding the resources, products, and physical characteristics of each State and Territory, and shall publish such information in different languages and distribute the publications among all admitted aliens who may ask for such information at the immigrant stations of the United States and to such other persons as may desire the same.

Live Stock and Dairy

COW CARE.

THE expense of raising calves on a dairy that sells milk is often a tax on the profits that is illy borne. It is for this reason that the man having cows in the country and selling butter fat only, has a chance of a heavy profit by selling off his herd of cows at seven years old. He receives four years of milk profits out of them and then turns them over as a developed herd to the city man at a further profit. The cows going in car load lots are not worried by the change and go right along in their milking. The buyers will come back year after year, or send their friends. This can be made a regular industry, and it is profitable. The herd never grows old on your hands, and the profits come in regularly after a certain number of years. The selling of single cows is annoying business, for it takes too much time and the association with the class of cow buyers is unpleasant. They do not raise one's opinion of humanity and that is a misfortune.

Losses.

In the average herd of a hundred cows, losses are about six head a year when the cows are of various ages. Among these losses are the culls sent to the butcher as well as those that die from natural causes. Many of these losses are saved when the herd is sold off at seven years of age. The reducing of losses has to be considered more than the making of gain in these days of financial pressure. In California, or at least in this part of the State, we are not good economizers, we simply can make money easily and when it becomes a little short turn around we make rather than to cut down and save on expenses.

* * *

Fresh Cows.

As soon as a cow drops a calf, she should be watched carefully. After the cow has made the calf's toilet, remove it far enough away that it cannot nurse, but is within sight of the cow. The only reason why a calf should suck a cow is that of reducing inflammation of the udder. This is hard on the calf's digestion, for the milk is apt to be affected. As soon as the milk comes into the udder, enough should be drawn to relieve distention. Feed this to the calf at once. The first milk has a different character from the normal milk. It is a laxative and clears out the calf's stomach and bowels. It also starts the normal rennet juices in the stomach to care for natural milk. It is hard to make any young thing live and thrive that does not receive this first nourishment from its mother. This often is seen today in the human family; a little baby will live along maybe for weeks, puny and fretful, before its little life goes out. The doctors call it all sorts of names, this that ails the baby. These troubles would not have come had the baby started off in life in the natural way by receiving its nourishment at the maternal bosom.

Milk Fever.

The cows that are fresh need watchful care. During the first forty-eight hours avoid milking them out clean. Draw only enough milk to feed the calf and relieve distention of the udder. Milk the first two days, three or four times a day, and feed the calf each time. The men of the Isle of Jersey were the first to discover this prevention of milk fever. The Americans were slower to learn their lesson. A few years ago, milk fever was a scourge that kept the dairy industry down. The dairyman always lost his best milkers from this disease. The breeders of fancy cows had to lose by light feeding, the first flush of milk for fear of milk fever. Men preferred, as more practical, scrub cows, for they were not often victims of the disease. Back in Pennsylvania when I was a child, the men sat up all night with a fresh cow, having her in a room with a fire. They had observed that a cow was not as likely to have milk fever when kept in the stable in the winter time as when she was out in the field. The protection from chill saved the cow from milk fever in many cases, no doubt.

Milk Fever.

When nature's conditions are violated and milk fever comes, it is no longer deadly if promptly treated. Where there is a good veterinary at hand send for him. He will have the air pumping outfit needed. A sterilized milking tube is inserted into each teat and the udder pumped full of air. This is putting back the distention the removal of all the milk had reduced. In a large herd the dairy room should be supplied with a milk fever pump and a trocar for bloating. These two troubles may occur at any time in a herd. Both are deadly if not promptly treated. Where the distance is great to town, or there is no qualified veterinarian, then try to relieve the trouble by using a bicycle pump. This is attached to a rubber tube and the tube has the milking tube fastened to it. The milking tube is carefully sterilized in hot water and slipped into alcohol while carrying to the barn. If the teat is very small it may be necessary to oil the tube; this is done by putting it into a bottle of vaseline. A set of milking tubes are needed on every farm no matter if only a couple of cows are kept.

Garget.

The air treatment is the best thing for garget. If used early will

A SURPRISE.

I assure you it gave me a very pleasant surprise to see the recent Cultivator which was devoted to the stock industry. I appreciate this number and am sure it will be of value to the stock and dairy interests of this State.

MILK CANS ROB YOU

Look through a microscope at milk set to cream in pans or cans and you'll see how they rob you. You'll see the caseine—the cheese part—forming a spidery web all through the milk. You'll see this web growing thicker and thicker until it forms solid curd. How can you expect all the cream to rise through that? It can't. This

caseine web catches a third to half the cream. You stand that loss just as long as you use pans or cans for they haven't enough skimming force to take out all the cream. But, just the minute you commence using a Sharples Dairy Tubular Cream Separator, you stop that loss.

Sharples Dairy Tubular Cream Separators have 10,000 times more skimming force than pans or cans, and twice as much as any other separator. They get all the cream—get it quick—get it free from dirt and in the best condition for making Gilt Edge Butter. Caseine don't bother the Tubular. The Tubular is positively certain to greatly increase your dairy profits, so write at once for catalog I-260 and our valuable free book, "Business Dairying."

abort an ordinary attack that comes from colds. The attacks that come from blows or horns will have to run their course. These cases, however, are helped greatly as the inflammation is decreased. The best part of this treatment is that any one can use it that is cleanly. The cow is put into the usual place where she is milked. The operator sits down on a milking stool and gently inserts the milking tube and pumps in the air. After all the air is pumped in that the udder will take up, sit still a minute or two and then see if a little more will be received. The little crackling sounds as the air penetrates and inflates the tissues, often alarms the operator, but it does no harm. The portion of the udder not affected can be milked out clean before beginning the air treatment. When the tube is withdrawn sometimes all the air follows it. The best thing to do is then to put a rubber band around the teat after the quarter has again been filled up. The rubber band should be slipped over a card, a visiting card folded over the teat, to equalize the pressure will prevent strangulation. This rubber should not be used for more than a few days or the teat may be injured. These cases of garget usually yield after two or three treatments, if the cow is dieted at the same time.—M. E. Sherman.

A GOOD SHOWING.

The following is from a reliable publication:

Not long ago a farmer in Iowa went to a harness dealer to buy a team harness. He found one that suited him and the price was $45. The farmer happened to remember that about a dozen years ago he had bought a harness just like it from the same dealer for $35, and he mentioned the fact. The dealer went to his books and found this to be true. "But," said the dealer, "my books show that you did not pay cash for it, because you did not have the money. You hauled in 300 bushels of corn and gave it to me for the $35 harness. Now I will tell you what I will do. If you are willing to bring me 300 bushels of corn I will give you the $45 harness, also a double buggy driving harness, also a plush robe worth $7, a boys' riding saddle, worth $5, one pair of wool blankets, worth $7, one whip and riding bridle, worth $1.50, two leather halters, worth $2.50, brush and curry comb, worth $1, and a rawhide buggy whip, worth $1."

RICH NEWSPAPER FUTURITY.

One of the richest and the most liberal futurity stakes ever offered for trotters and pacers is being promoted by the Horseman and Spirit of The Times of Detroit, Mich. The stake is guaranteed to be not less than $15,000, and according to conditions, all the money contributed to the stake by breeders in the shape of nominating and starting fees will go into the stake as added money.

The stake will be raced in three divisions: For three-year-old trotters there will be a purse of $10,000; for two-year-old trotters the purse will be $3000; for three-year-old pacers $2000.

Three hundred and twenty thousand acres more of forest reserve has just been created by the President, who has signed a proclamation for the Prescot National Forest in Arizona.

The Peach Industry

I HAVE been asked time and again, both in person and by correspondence, whether the growing of commercial varieties of peaches, apricots, nectarines, prunes and plums will ever reach a stage whereby the growing of these fruits will be overdone.

In answer to these many enquiries I shall take up the matter separtely, and give my views on the fruit industry in general as it is carried on in California, from a nurseryman's standpoint, and, as far as possible, give a practical view of the subject.

I contend that the growing of drying and canning peaches will never be overdone, and, I give as my reason, the limited area in the United States which is suited for the growing of this fruit on a commercial scale, and especially in the dried and canned state.

In the first place the peach will thrive and produce in any section of the United States, from Canada on the north to Mexico on the south, inculding these countries, and from Maine to California. The demand for dried and canned peaches from California is reaching greater proportions every year, and one would naturally want to know why California is looked to to supply the demand for these classes of commercial fruits. It is a very simple matter to explain.

In the first place there is only one section of the United States where peaches can be grown in order to produce a commercial—dried or canned-fruit, and that section is in California, commencing at, say, Red Bluff on the north, and ending at Yuma, Arizona on the south, except possiblly a few favorable locations situated in Arizona and New Mexico, where there is very little rainfall during the summer season.

In order to produce the commercial dried peach it is necessary to grow the fruit in a dry climate, which allows it to sugar up. In California we only water the trees when water is needed, while in other portions of the United States, where there is practically a continual all-the-year-around rainfall—that is, it is liable to rain at almost any period of the year—the fruit in such localities becomes too watery, hence its inadaptability for drying and canning purposes.

This accounts for the mushy condition of Eastern-canned peaches and the drying-away of the fruit when drying is attempted.

About six years ago I made a trip throughout the peach growing sections of the United States, especially in Mississippi, Alabama, Georgia and the Middle States, for the purpose of getting data on the peach, in a commercial way. I found that it was next to impossible to produce a peach in those localities that would make a commercial-canned or dried product. The Eastern peaches when canned, although apparently firm when put up, in a few months the fruit falls down and simply thickens the syrup, and gives the contents of the can a mushy appearance. They make what are called "pie-peaches" so largely used by bakers for pie making. Not so with our California peaches.

The California fruit remains firm, even if kept in the cans for fifteen years or more, and when opened it is as firm as when first put up. This condition is due to the fact that our dry climate produces a fruit that is firm and sugary, and all the surplus water in the fruit is practically eliminated before it is canned or dried.

What is the result when Eastern peaches are dried? They simply dry away and nothing remains, but the skin. If this was not the case, how is it that we are called upon to supply the commercial-dried peach, when the peach, as already stated, is grown so largely all over the United States? When the Easterner cannot market his fruit in the green state, what is the result? Does he dry the same or can it? Why does he not do it to prevent a green-fruit glut? He simply cannot make a commercial product, owing to the fact that Eastern-grown fruit carries too much water and is not firm enough for the purposes already named.

Take, for instance, the green fruit which is marketed. Is it not a fact also, that our green fruits always command higher prices than the Eastern fruit? Why? I shall tell you why in a few words: When our fruit reaches the Eastern markets, it is a well known fact that it keeps better owing to its firmness, is not subject to bruises which is the case with fruits that carry a high percentage of water. When an Eastern peach becomes bruised it rots rapidly, and the fruit stand man is the loser, unless he succeeds in working off the fruit as rapidly as possible.

California fruit is not only packed better, but it is firmer in every way, and, notwithstanding it travels a thousand miles further than most of the Eastern product, it reaches the market firm, highly-colored and in otherwise perfect condition, barring, of course, accident and unusual delays in transit.

The average life of a peach tree is twenty years, and it can be readily understood when you consider the limited area for growing commercial peaches that it is next to impossible with the constant demand and increased consumption to overdo this important industry.

I might say the same thing about apricots, nectarines, prunes, raisins, wine and table grapes. In the language of the street, California certainly has it on every other State as a producer of commercial fruits, and she has no equal in the production of peaches, apricots, apples, prunes, plums, citrus fruits, wine and table grapes.

There is nothing in the fruit line produced in other countries on a commercial scale that we cannot duplicate or excel, as far as quality is concerned.

The latest great achievement of our State is the growing and marketing of the commercial Smyrna fig, which practically completes the list and classes us as the greatest fruit section in the world.

We took hold of this Smyrna fig business (thanks to our fellow townsman, Mr. Geo. C. Roeding, for his determination and enterprise) and have brought it to such a state of perfection that there is nothing in the fig line that can excel the California Smyrna figs.

When we got the trees established they told us we needed a bug, or fig wasp, to fertilize them. This was a new phase of the subject. Did we

get the bug? Well, I should say we did, and we put it to work with every prospect that it will continue to work and make us wealthy.

If any of these foreigners thought we could not establish the insect they have since learned better. We do not have to harness them either; they work in their adopted home, both double and single, and it does not take a very large collar to fit their necks, either.—by Chas. A. Chambers, of the Fresno Nursery Company.

CUTTING CIONS.

It has been demonstrated by the most successful fruit growers that the cion from which a tree is grown has much to do with its prdouctiveness when it approaches the bearing age. Much has been said and written concerning the value of a hardy root for the trees in our orchards but, in my opinion, cions from productive annual bearing trees are fully as important to the orchardist.

These can be cut any time in the fall after the wood is fully ripe and the buds well healed. This occurs when the leaves fall and the buds are exposed for a time to the air which so hardens them that no loss of moisture will occur through these natural outlets during their dormant periods.

Select vigorous, hardy, disease-resisting trees for your cions. They should also have established the reputation of being annual bearers, producing fruit of high quality. We believe these characteristics may, in a measure, be intensified when great care is exercised in selecting the cions which are to be used in making the root grafts. The same principle also applies to the top-working of the fruit trees.

FUNDS FOR TEACHING FORESTRY.

A plan to be urged upon Congress at the present session is very commendable in its promise of beneficial effect. It is to secure instruction in forestry in the State agricultural colleges throughout the Union, and experiments in forestry to be made by the State experiment stations. The proposal is to add to the Morrill and Hatch funds, by which the colleges and stations are endowed, $2500 for each of these purposes—so much for forestry instruction to students, and the same amount for research, making a total of $5000.

The Davis bill, aiming at this end in a previous Congress, has been redrafted, and it is to be hoped that it will receive earnest support from the country. The income derived from the National Forests has been used for several years to put the United States Forest Service on a good footing. At its last session Congress directed that the income should no longer be used for this purpose, but covered into the Treasury. What could be more appropriate than to use a portion of it for adding to the people's knowledge of methods of preserving and economizing the woodland resources which they possess outside the National Forests? Four-fifths of the woods of the country are in private hands; and a large share of these are in the shape of farm woodlots. The farmers, at their colleges, should be taught to improve their timber crop as well as other crops.—Forestry and Irrigation Magazine.

AGRICULTURE IN THE PUBLIC SCHOLS.

A large per cent of the school taxes in California is paid by the agricultural class. It is, therefore, only proper that our common schools should be in charge of those who understand the elementary principles of agriculture.

If the trustees elected by the people, who have the common schools in charge, will insist that teachers shall know something about the fundamental principles of farming, of botany and horticulture, the higher schools will inculcate these branches in their courses of study and young men and women from these institutions will be required to teach, at least, the elementary principles of agriculture. Our common schools need more of this line of work. It has been neglected for higher mathematics and other studies not essential to success in farming.

The trend of population for many years will be toward the farm, and our common schools ought to be preparing the youth of the country for the life before it.

During this year let trustees of the common schools prepare for the coming year's work by hiring teachers who know something about agriculture. The best teachers, usually, are those who have had some practical knowledge of farming; add to this the training received in the State Agricultural College, and we shall have really well equipped common school instructors. We trust our agricultural college may make a strong point of preparing teachers for the common schools, for by so doing, the grade of our school system will be advanced, and our boys and girls given instruction which will be of value to them in any department of work in which they may engage.

THE BUSINESS OUTLOOK.

The country is recovering from the late financial storm. The clouds are breaking and there is a semblance of the old time activity which marked commercial and industrial conditions. The storm broke in New York, and it was to be expected that it would first show a clear sky at that point. So it has. The reserve deficit of the New York banks has disappeared. This deficit has not only been wiped out but in its place a surplus of millions has appeared. This is a happy outcome of a situation which has covered a period of ten weeks. It illustrates the inherent recuperative power possessed by American financial institutions. It is a testimonial to that same conservatism of American business men. It shows that whether gradually or unexpectedly they are brought face to face with a crisis they have the capacity to meet it.

The commercial agencies are all agreed that the present outlook is brighter than for some time. Money is easier. While trade is more or less quiet, as is natural this time of year, marked improvement is discernible.

It is not a refutation of these stories of betterment to say that effects of the late financial unpleasantness will continue to come to light for some time. Business failures continue to increase but that is to be expected. They will keep coming for some little time. However, these are the aftermath of the recent troubles. The number of these failures will materially lessen as the process of readjustment is carried toward completion.

There has been great improvement in the bond and stock markets. Those who made conservative investments in good railway and industrial bonds are beginning already to see the wisdom of their action, while stocks are commencing to climb back in the direction of the figures around which they clung in normal times. California is proportionately less affected than almost any other State. Our failures have been fewer and their volume less heavy. There will be a steady return to normal conditions as the output of our products swell the bank balances of the growers. While there is no cause to worry in California, there should be no such extravagance indulged in, in the future, as there has been in the past. We ought to get back to first principles regarding our methods of living and stay there.

GROW FOR HOME CONSUMPTION.

We often wonder why every owner of a piece of land does not grow thereon about everything he needs for home consumption. The theory that he can devote himself to a specialty, raise one thing, and sell it, and then buy what he needs for his own use is very altruistic, but exceedingly expensive and visionary.

If things could come out as we figure them we might all be rich, but they don't. For a cycle of years they bring success, we make money and are contented. Then the conditions change and reverses come and we are hard run. Now, if we have been wise, our land is so platted and cultivated that we are able to raise everything we need along the line of garden truck, and our expenses, if we own some chickens and a cow, are within our range. We all know that specialties fail, sometimes, and the only safe rule for every tiller of the soil is to raise enough to live upon if he has to and if he has any surplus he can market it. Every dollar saved in this way is a dollar earned.

Make up your mind to look after the home table fully as well as anything intended for the market. In doing so you make many a dollar, in addition to being independent of the local store or the huckster.

Vegetables we buy out of the grocery and out of wagons are often stale and tasteless, taken fresh from the ground they are succulent and delicious. Onions, peas, tomatoes, cabbage and lettuce can all be grown on small plots and make one rejoice when he eats them that he knows where they were raised and just how.

STATE CONVENTION.

An effort was made at the recent State Fruit Growers' Convention at Marysville to hold the next convention in Southern California. Riverside promptly got busy and is proposing to capture the honor. In case Riverside should be chosen, the convention will doubtless take the nature of a citrus meeting. This would have several advantages. First it would greatly benefit Riverside and the whole citrus industry, it would give the northern members who attend an idea of citrus conditions in the south. The State convention is usually held in the northern end of the State, and should, for the benefit of the growers in the north, as well as those in the south, be held in the southern end occasionally.

Another advantage to the citrus industry would be that the State Horticultural Commissioners could print the complete proceedings, which would give a fund of citrus information which is greatly needed in this State at this time. It is a long time since there has been given a publication touching upon our greatest fruit industry.

By all means give us a great State convention which shall be along citrus lines.

LIVED ON $10 A MONTH.

Talking with a farmer who has lived in California for a quarter of a century, about what a family of four persons can live on, where they own ten acres, he said: "I was here in '93 when we had a real panic, not a make-believe, such as we have seen recently, and I had a wife and two small children. I lived at a cash expense of $10 a month. My orchard was young so I planted my garden between the rows of trees and cultivated it without injury to the trees. I had two cows that furnished me with all the milk and butter we needed, and my garden raised all the vegetables for the family. Fifty hens kept us in eggs and we sold enough out of the excess of butter and eggs to pay most of our grocery bill, flour included. About all the money I spent was for clothes, and taxes, for our chickens and pigs supplied us with meat. We had no doctor's bill and I repaired my farm machinery myself, and we never were more comfortable than during the years we lived on $10 a month."

The point in this individual case is, that the farmer raised almost everything he required; he had three acres in alfalfa, and it kept his cows and pigs and one horse, which did the work on the ten acres. He did not hire help on his place, nor did he spend much time in town, he simply toiled and managed, and today is one of the most prosperous growers in Orange county. The moral of this incident is that the small farmer should raise everything he needs to eat except groceries, and this he can do if he puts in the right kind of crops and keeps cows, hogs and poultry. One cow is not much good on a farm, for every cow has or ought to have a dry season. Two cows, therefore, should be kept and they will not only provide food for the family, but there will be surplus butter to sell and skim milk for the pigs. An acre of alfalfa, well cultivated and attended to, will produce four tons of hay during the year, which will give a daily ration of twenty-two pounds. Three acres with the assistance of other crops will later on keep two cows and a horse and one horse will do the work on a ten-acre place.

THE CULTIVATOR GROWING.

While some of our best exchanges have been forced to reduce the size of their publications, others to change to a monthly, and still others to abandon the field altogether, the Cultivator has found it profitable to run extra editions devoted to special topics, with from one to two thousand additional circulation. In short, the last year has witnessed big growth in subscribers and advertising patronage, and in that time, the months of November, December and January, have proven the best of the year.

J. O. of Princeton says:

"I find it well nigh impossible to get along without the **CULTIVATOR** and enclose $1.00 for next year."

J. A. D., Highlands, says:

"We find many helps in your paper and don't feel that we can afford to be without it."

Agricultural Notes of the Pacific Coast

Northern California

Colusa was still picking tomatoes on the 13th of January.

Butte county will soon claim the largest power line in the world.

Sunset telephone is being extended amongst many of the ranches around Santa Rosa.

A new dairy of over 200 cows has just been established at Bonito in Livermore valley.

The Sacramento river is falling, and is nearly normal again after its recent high water.

Central Canal Company of Glenn county is getting water on its land in fine shape this year.

Members of Glen Ellen Grange held an interesting all-day session at Santa Rosa last week.

Cloverdale fruit is ripening nicely, and a good, fair crop is promised for that section next month.

The output of the coast counties' dairies is increasing every day with the improvement in the feed.

Extensive plantings of almond orchards will be made in the neighborhood of Marysville this season.

Prof. Babcock of the State University, is making an investigation as to fruit tree diseases at Fair Oaks.

It is reported that Luther Burbank has produced a wonderful plum at his experimental gardens near Santa Rosa.

Instead of filling, as is usually the case at this time of the year, Tule Lake, Yreka, is lowering at the rate of one inch every two weeks.

The report of the secretary of the Farmers' Mutual Fire Insurance of Yolo county shows total risks amounting to $202,298. The company has sustained no losses during the past year and is entirely free from debt.

The Santa Rosa grange installed the following officers: H. S. Stone, master; H. N. N. Latimer, overseer; C. E. Wingate, lecturer; Mrs. H. S. Stone, chaplain; Miss Fannie Gamble, secretary; John Strong, treasurer; Harvey Gregory, steward; C. A. Williams, assistant steward; George Smith, gatekeeper; Mrs. Charles Gillett, Ceres; Mrs. A. Kettlewell, Pomona; Miss Judith Coulter, Flora; Mrs. John Strong, lady assistant steward.

Sacremento Grange No. 12 has installed as officers for the coming year: Worthy master, Joseph Holmes; overseer, J. H. Beach; lecturer, Alice Madinson; steward, Edward Booth; assistant steward, C. E. Reeze; chaplain, Mrs. C. E. Reese; treasurer, D. Flint; secretary, Lillie M. Orr; gatekeeper, Mark Hunt; Pomona, S. F. Ingham; Flora, S. S. Slawson; Ceres, Carrie R. Holmes; lady assistant steward, Mamie Sanford; pianist, Mabel Holmes.

The Pomona Grange of Sacramento county recently installed the following officers: Worthy master, Geo. W. Hack; overseer, George Schlmeyer; lecturer, Sylvia Fitzgerald; steward, F. W. Bush; assistant steward, Geo. A. Biggs; chaplain, Katie C. Jackson; treasurer, Daniel Flint; secretary, Joseph Holmes; gatekeeper, H. Muddox; Pomona, Etta Cornell; Flora, Grace McDonnell; Ceres, Berdina Hack; lady assistant steward, Alice Madinson; pianist, Macey M. Bush.

Central California

Tulare Farmers' Institute was held last Monday.

The rainfall at Exeter for this season amounts to 2.56.

Delona ranchers are busily engaged in planting grain.

Cantaloupe buyers are making propositions to Turlock-Modesto farmers.

Leonard Day has been appointed county fruit inspector for San Benito county.

Tulare county's 2500 cars of Washington navels have mostly been shipped.

Ranchers at Oakdale east of Tulare are having a mutual telephone line installed.

The Kings county stock growers have found the past season one of great profit.

Beekeepers at Gilroy report that the industry has proved very profitable in that section.

Visalia's rainfall up to the present amounts to 3.82, which is just about half that of last year.

The people of Porterville have voted to issue $50,000 bonds for developing a water system.

Lindsay is boasting of ripe tomatoes marketed in January, and grown in the open without protection.

The Linden Grange at Cupertino installed officers on the 10th and closed with a delightful banquet.

The whole San Joaquin valley was visited by a fine rain last week, in some sections over an inch falling.

Clovis will hold a farmers' institute on January 27th, and a strong committee is at work on preliminaries.

The last rainfall at Salinas was practically an inch, and has placed the beet fields in excellent condition for planting.

F. H. Wilson and others have brought tracts of land in Fresno county along the foothills and will plant oranges.

The bed of the Kings river at Laton is being cleared of many trees and undergrowth to give easy flow to the waters in time of storm.

Berkeley has organized a juvenile horticultural society, the membership of which are children willing to take up a series of planting experiments.

A writer from Honolulu says that the Tulare county oranges sold in that market at fairly good prices and received many compliments of their fine quality.

The horticultural fund in Santa Cruz county is only $1500, which, when divided into its various budgets, will leave only a slight fund at the disposal of any one department.

Articles af incorporation for the Mysa Land & Cattle Company were filed in the Monterey county clerk's office last week. The principal business will be the breeding and selling of live stock.

The farmers at Wasco gave a rabbit drive last Saturday under the management of the Improvement Club. Over 200 rabbits were killed and sold, the proceeds to be given to the Women's Improvement Club.

Southern California

Anaheim is asking for a fruit cannery.

Orange county has 3000 acres of alfalfa.

There will be about 700 carloads of cabbage shipped this year.

Covina's Farmers' Club held an interesting meeting last Saturday.

Riverside has planted 5000 shade trees during the last two years.

Redlands has shipped something over 700 cars of oranges to date.

Whittier and surrounding county has a total of 1000 acres of cabbage.

Southern California produces $2,000,000 worth of dried fruits each year.

San Bernardino has a rainfall to date of 4.33 inches as against 14.19 in 1907.

Large plantings of citrus trees will be made in the Imperial valley this season.

Shipments of California oranges now going forward amount to 100 cars daily.

Santa Ana is shipping 50 sacks of sweet potatoes daily to the Los Angeles market.

Many seedling walnut groves in Southern California will be grafted during the spring.

Southern California canners are in the East arranging for next year's canned fruit output.

Ten carloads of cattle were shipped into Chino last week to be fattened on sugar beet silage.

Cantaloupe men in the Imperial valley are plowing their land the second time preparatory to early planting.

The Kingsbury marmalade factory at Redlands is working up a large quantity of cull oranges into a high priced product.

G. Harold Powell will make another series of investigations this year in the shipping of oranges and the cause of decay.

Highland had trouble with her Japanese labor until forbearance ceased to be a virtue, and she has expelled the entire bunch.

The Gage Irrigating Canal Company recently elected the following officers: C. E. Rumsey, James Mills, C. H. Low, R. M. Ivring.

It is rumored that the effort to have the government control the Imperial irrigation project has fallen through for want of funds.

Orange packing houses have slowed down somewhat, owing to the lighter demand for oranges. The shipments are about 100 cars per day.

Colton is expecting the early construction of a $300,000 icing plant, which will fill refrigerated cars of oranges prior to their long trip East.

The Riverside Enterprise says that the new winter vegetable chayote will prove a winner in the winter vegetable market in the early future.

Forest officials will not allow uninspected cattle to graze on the Trabuco Reserve, and it is required that all stock grazing there shall be dipped.

The Packers' Supply Company at Redlands which is pushing the manufacture of pulp board boxes, are continually extending their factory and are now adding large supplies of new machinery almost daily.

The Coast

The Inland Threshers' Association met at Spokane last week.

Moscow, Idaho, will hold a farmers' institute January 27th to February 3d.

Montana reports a bright outlook for the wool growers the coming season.

The Great Falls, Montana, Poultry Assoniation is holding its show this week.

Coyotes recently killed 47 head of sheep on one ranch at Wilson Creek, Washington.

The State horticultural meeting of Oregon was held last week in the city of Portland.

The Walla Walla, Washington, Poultry Association is holding its annual show this week.

The 13th annual show of the Oregon Poultry Association occurred last week in Portland.

Winona, Washington, which ten years ago was a desert, will ship this year 325,000 bushels of wheat.

The third annual Wheat Growers' Convention was held in Pullman, Washington, January 9th and 10th.

The annual meeting of the Washington State Horticultural Association will be held at Walla Walla January 29, 30, 31.

The first importation of live poultry in several years was received at Spokane last week.

Dallas, Oregon, fruit men are making a pull for a cannery of that place to handle the surplus fruit.

The Fruit Growers' Association of Columbia county, Washington, held a meeting at Dayton last week.

The State chemist of Washington is visiting various condenseries and making chemical analyses of the milk.

A tree grower at Portland, Oregon, is growing some cedars of Lebanon, the seed of which is received from the Holy Land.

The president has just signed a proclamation creating the Verde National Forest in Arizona. It will contain 721,780 acres.

The farmers at the institute held at Monmouth, Oregon, took a greater interest in the horticultural subjects presented than ever before.

At a wheat growers' congress at Waitsburg, Washington, the question of sacks was thoroughly discussed in a "sack day" feature of the program.

Walla Walla stock growers have formed an auxiliary to the Washington State Growers' Association. This is the first auxiliary formed in the State.

Tests are being made at Klamath basin to determine the adaptability of that section to sugar beet culture. It has been found to be a very successful test.

The Spokesman Review says that there are wheat farmers near Spokane who lavish as much affection on their families as they do upon blooded live stock.

North Yakima sheep growers are pressing for permits to gaze their sheep in the Ranier Reserve. The sheep on this reserve have been reduced during the last two years so that instead of a quarter of a million there are about 60,000 grazing there now.

PEACH PLANTING ADVICE.

ACTIVE work in orchard planting has commenced and, as has been the case for several years past, the peach is far and away the favorite fruit. There has been a peach boom in this State for the past three or four years and nurserymen have not been able to fill their orders. There have been unusually heavy importations of Eastern peach trees to meet this demand, which does not seem to lessen. There will be more peaches, chiefly canning varieties, planted during the present season than ever before, and probably more than all other varieties together. Next in favor are table grapes, and the acreage of both these fruits in the State is going to be very largely increased this season. Already heavy importations of Eastern stock are coming in and nearly all are peaches.

A PROSPEROUS YEAR FOR FARMERS.

The fruit growers and farmers have balanced their books for the past year and reports are coming in from all parts of the State giving returns, and these generally show a balance on the right side for the producer. In most cases field crops have been reported as better than average, in few cases below; with fruit, the growers generally report satisfaction. Apricots have been a failure, at least the crop was so light that it may be so accounted; with most other fruits there was a shortage in yield, but the prices received have fully compensated for that, and growers have done better than for some years past. While this is true of the past, the prospects for the future are even more promising. The elimination of the private car line system with its ruinous rebates and the control of the Eastern markets in the interest of one firm, has done very much to brighten the prospects of the California fruit grower. In bringing about this condition, the Southern Pacific Railroad has gone to an enormous expense in providing its own cars for the California fruit trade. These are of the most modern pattern and fitted with all known appliances for careful transportation of fruit. In addition to this, the company is erecting pre-cooling plants at all the important fruit shipping points, in order that fruit may be started on its overland journey in the best possible condition. One of these new plants now under way at Roseville, the chief fruit shipping point in Northern California, will have a capacity for cooling 500 cars daily. With private cars out of the running, all fruit pre-cooled, and good refrigerating conditions, there is but one thing needed to bring the millennium to the fruit growers of California and that is, expedited service on schedule time, and this we may hope for soon.

THE FRUIT SULPHURING PROBLEM.

The question of sulphuring our dried fruits is once more attracting attention from the fact that the government chemist has declared against this process and, under the ruling of the pure food act it is declared illegal.

The amount of sulphur taken into the human stomach in dried fruit is so infinitesimal that it could not probably do any damage, while without it, dried fruit would lose much of its attractive qualities. Sulphur not alone whitens the fruit, but it destroys all insect eggs that may have been deposited on it, closes the pores and enhances the keeping qualities of the fruit; it prevents evaporation, and sulphured fruit will keep longer and in better condition than that which has not been treated. Unsulphured fruit is dark colored, uninviting, and soon becomes infested with insects and is so rendered unusuable. There are so many advantages in favor of sulphuring and so few against it, that it would not seem difficult to have the Department of Agriculture allow it within reasonable restrictions. Secretary Wilson, when in California last fall, was confronted with this problem and promised then that no action should be taken against the use of sulphur last season, but it is now time to secure a permanent ruling in regard to it. The State Board of Trade and the Commission of Horticulture are moving in the matter and it is hoped that much of the stringency of the ruling may be relaxed.

CONTROLLING THE WHITE FLY.

The White Fly scare seems to be somewhat subsiding, as we get better acquainted with the pest. It is still with us, but the precautions which have been taken against it and its spread, give every assurance that it will be kept within reasonable bounds, if indeed, it is not exterminated, and that now that we know of its existence and the danger to be met, it will be controlled and little fear of its spread need be entertained.

A VALUABLE PUBLICATION.

The university has just issued a very interesting and valuable bulletin compiled by H. J. Quayle, entitled "Insects Injurious to the Vine in California." The work deals with all the various pests which are the bane of the viticulturist's existence, and gives the methods of handling them. It is very comprehensive and a valuable addition to the literature on that subject.

PEAR BLIGHT STILL WITH US.

Pear blight seems to have got the best of the fight, and those who have carried on the most strenuous fight against it have almost given up in despair, and unless some unforseen act of providence interferes, it now seems that the pear industry of California is doomed. Pear blight can be controlled; that has been demonstrated, but for this purpose skilled labor and constant watchfulness and unanimity of action are required. If everybody in a pear growing section knew just how to work and everybody worked intelligently together, then there might be some hope from artificial remedies. Professor Waite with his force of experts has been able to do the work, but Japanese, Chinamen and the average white worker in the orchard have not the training or ability of these professors and will not do the work, and so the blight spreads in spite of our best efforts. It may be that some day some counter-action will take place which will check the spread of the disease—it will run its course as some say—and we may grow pears again, but at the present time the outlook is not encouraging.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

SOME POULTRYMEN MAKE MONEY.

WE received a letter which we give below. The writer has some erroneous ideas in reard to poultry culture. He thinks ily a favorite few are making oney out of the chicken business. hese few are the ones writing artiés for the papers and the fancy reeder that can induce the sucker part with his money for fancy ock. In part the letter is:

he Grouch.

Honestly, don't you think there is good deal of humbug about this hicken business, I mean the fact of uying all of your feed, keeping the ens yarded, and expect to get your ioney back selling eggs and chickns at market prices. Is it not true iat the only ones getting any ioney are the ones who are writing rticles for the papers or those who an induce simpletons to part with 5.00 to $25.00 for a setting of eggs, r succeed in selling stock for $5.00 $25.00 a head? When down atending the poultry show at Los Aneles in December I saw in a poulry journal that some paid $7000 or 11 chickens; probably the buyer eceived back $6795 for luck. Tricks n all trades.—W. T. K., Santa Ana, al.

Now, we wish to make a few more omments upon this worthy epistle, for ve wish to correct, at least, two oints in Mr. K's mind. The first, hat the ones who are writing artiles for the paper are not the only ones who are getting the cream of he business. We will frankly admit hat we are able to buy a business lock each month on Broadway from evenues that we receive from our writing, but there are others.

As for the man who is selling breeding stock and eggs for setting at fancy prices, we will admit that there are some in the business that are making money out of this particular line, and we are glad of it, and are sure that as long as they correctly and honestly conduct their business on business principles, they will continue to make money. The backbone of the poultry industry is the fancy; take away the fancy and the business will surely be less profitable for the painstaking breeder who has raised the standard and been an encouragment to the commercial poultryman.

We don't class those who buy eggs and stock at fancy prices "simpletons" or "suckers," for if the reader will look back into the matter further he will see that the best and most progressive business men of today pay the highest prices for breeding stock, and any one who has the goods can land the orders. If any one is in doubt, let them produce the stock and they will find a ready market at a good price. As to the fabulous prices mentioned we know nothing, but, of course, there is reason in all things. But good stock costs money to produce and will always command fair returns.

Practical Side.

As to the practical side of the question, we publish herewith a letter from Mr. Hyatt, of Petaluma. It was not written for publication, but we are sure that Mr. K. will see it is not a hot air proposition.

I am in receipt of a copy of the California Cultivator, and I believe I am a fortunate party to win the beautiful cup presented by you for best White Leghorns in novice class, competing at the last show at Petaluma. I thank you for the interest you have shown in our association, and I trust you will note a growing interest in the Cultivator as it is known among us, and I will take special interest in introducing it among the poultrymen of this district. This was my first attempt in the show room, although for fifteen years I have been in the poultry business, with nothing else as a business; have made a speciality of fine eggs for hatching purposes in large lots, having sold as high as 7552 dozen eggs in one year for hatchings, S. C. W. Leghorns exclusively. As I was born and raised on the farm, I naturally think there is no place like home and no home like the old home on the farm, and I soon learned that poultry paid the best returns for money and time invested; the soil each year grew richer and produced more. I can look back and see I made no mistake when I took up the poultry business —R. M. Hyatt, Petaluma.

* * *

AROUND THE YARDS.

We have received a number of inquiries for a balanced ration, and as all send practically the same list of grains, we publish only one formula for all. We give, however, a whole grain and a ground ration.

The inquiries come from W. W. Whitehead, Santa Ana; Miss Maud Leach, Porterville; Mrs. J. C. Housey, Oroville and J. B. Lawyer, South Pasadena.

Whole Grain.

To be fed in litter or in troughs not to be kept before laying hens.

Forty pounds wheat, 15 pounds oats, 10 pounds barley, 20 pounds Egyptian corn, 10 pounds cracked corn, 1 pound charcoal; to this might be added 10 pounds coarse beef scrap.

Ground Feed.

To be fed in hoppers:

Forty pounds bran, 20 pounds middlings, 15 pounds feedmeal, 7½ pounds beef scraps. This fed in hoppers, with grit and charcoal constantly before them, will give excellent results.

It is also a good idea to feed a good tonic at intervals in limited quantities.

* * *

Canker.

I have a Leghorn hen that has a lump of hard, yellow substance around her tongue and in her throat. It smells very bad. It can't eat very well. Would like to know the cause and cure. Also an old cock similarly troubled died suddenly.—A Subscriber.

Your hen has canker. Clean off white substance well and put eucalyp-

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

A Balanced ration made of pure grains (cracked), Seeds, Beef Scrap Charcoal. No grit no waste or bowel trouble in feeding this feed.
Will send freight prepaid to any address for $3.50 per 100 lbs. Arizona points 50c extra.
Pioneer Hatchery 711 South Main Los Angeles, Cal.

The La Habra ostrich farm east of Fullerton has 180 acres of land with all necessary equipment for care of the birds. There are now 500 birds on the place.

The recent fall of from one-half to over one inch of rain over Southern California did a world of good, especially to grain crops which had begun to suffer severely.

tus oil and cover well with flour of sulphur. Or if you have a good, well-known roup remedy, apply as per directions until cured. Your cock probably had canker of the windpipe, which is very hard to do anything with. We would look for cause and remove. There are a number of good roup remedies advertised in these columns; get one and use according to directions till all symptoms of disease disappear.

Hatching Geese Eggs.

When is the proper time to hatch geese eggs, and is it advisable to have them hatched by a large hen?—J. K. G., Eden Vale.

Set your eggs when you have them. As a rule, geese only lay in the spring.

Sultans.

Will you please tell me through the Cultivator where I can get Sultan and Partridge Cochin eggs? I think the Sultans are generally classed with the Polish stock of chickens.—Ethan Mathis, Plano.

Will some of our readers that have the above breeds write Mr. Mathis or send names to this office and we will forward to him.

Open Front House.

In building an open front house (the front facing the south) for laying hens, having shed roof, is it advisable to have the back of the house higher than the front? Are continuous houses for laying hens, say from 150 to 300 feet long, useful in California? —Guy B., Upland.

Make front of house higher than back, so sun will shine in and keep thoroughly dry during wet season. To keep out rain you can use a burlap curtain, which can be rolled up in fair weather.

We never advise houses 150 to 300 feet long, as there will be a draft unless there are tight partitions at regular intervals to prevent. Aside from this the continuous houses are all right.

POMONA SHOW.

The first annual show of the Pomona Poultry Association was held in Pomona last week under the management of C. C. McKey. Mr. McKey informs us that the numbers of entries would have been much larger had there been more room. He had to return birds as it was impossible to coop them.

The show was held in the Co-operative building on Second street, and was packed like a street car returning from the beach. Even the gallery had to be utilized in cooping birds.

The quality of many birds was as good as is found at larger shows, while the attendance was all that could be expected. The judging was done by Frank H. Thomas of Los Angeles and S. Tyler of Pasadena; the ribbons were up by Monday at 2:30 p. m. when the doors were opened to the public.

As a whole, the show was a credit to the industry and will do much in encouraging, stimulating and educating the fanciers.

Robber Hens

Over-fat and lazy fowls—always ready to eat, never ready to lay—take the profits out of your hen business. Put such by themselves, reduce the feed a few days, and then begin the use of Dr. Hess Poultry Pan-a-ce-a once a day. This course will soon turn robber hens into profit-paying fowls.

DR. HESS
Poultry PAN-A-CE-A

is the prescription of Dr. Hess (M.D., D.V.S.) himself an expert poultryman, and was formulated with the express purpose of providing something to strengthen the fowls' digestion and *compel* the largest possible assimilation of nutriment. That it does this is the testimony of poultry men in all the United States and Canada. It holds bitter tonics, iron for the blood and cleansing nitrates to purify the system. Makes laying a habit and helps young chicks grow fast. It is also a great preventive of disease. Costs but a penny a day for 30 fowls.

Sold on a written guarantee,
1½ lbs. 35c; 5 lbs. 85c;
12 lbs. $1.75; 25 lb. pail $3.50

THE SAN DIEGO SHOW.

San Diego Poultry Association gave a very successful show this year. Not only was the show a success in numbers and quality of the birds shown, but Secreary Stiles informs us that financially the show is a winner. The boys at San Diego have been up against a hard run of luck for the past few years and we are glad to hear that they are getting on the sunnyside of the street.

We had wanted to get a full report of the winnings of the show, but they did not reach this office until January 2, 1908, after we had our paper for the issue of January 9th in type so were unable to give same until it was too late for them to be news. We hope to receive reports earlier next time as the Cultivator is always willing and anxious to give full reports of California shows when we can get them.

An Imperial farmer who paid $10 per acre 6 years ago has just sold his quarter section for $100 per acre.

Barred Plymouth Rocks

Ocean Blue Strain

D. T. Wieland, Moneta, Originator

This strain has been bred in line by me for 19 years and never defeated in the show room. For 16 years our pullets have never lost first prize. At the big Chutes' show 1908, we won first and second pullet in a class of thirty, nothing else shown. Eggs $2.00, $3.00 and $5.00 per 15; incubator lots at $8.00 per 100. Eggs now testing fine. We have purchased the best son of the first Chicago pullet, 1907, to head one of our pens. A first prize cockerel heads our cockerel breeding pen. Other pens the same breeding and good ones.

Take short line car at 2nd and Spring Sts., via Gardena; get off at Illinois at Moneta. Right on Ranch.

MISSION VIEW POULTRY RANCH

At the Los Angeles County Poultry Association Show, Dec. 7-14, 1907; White Wyandottes, 1, 2, 4. 5 cks; 1, 2, 3, 4 ckl; 1, 2, 3, 4, 5, hen; 1, 3, 4, 5, pul; 1, 2, 3, 4, 5 Pen; MAMMOTH BRONZE TURKEY—1 adult, 1, 2, 3 yearling; 1, 2 young tom; 1, 2, 3, 4, 5 hen; and 2 on ten pullet pen; 1, 2, 3 pullet.

Out of thirteen possible specials I won ten as follows: The Times cup for best display of White Wyandottes, the Los Angeles Produce Exchange $50.00 silver cup for best display of table fowl, the Henry Albers loving cup for best pen of White Wyandottes, Harper & Reynolds Company's handsome carving set for best display of White Wyandottes, the Superintendent's cup for best display of any one exhibitor of any one breed, a California incubator for best display of turkeys, the Association cup for best White Wyandottes, the National White Wyandotte Club cup for best Wyandottes, all the National Wyandotte Club ribbons for best cock, cockerel, hen and pullet; and in the competition open to ladies only; cut glass vase for hen and ten chicks in a large breed; and cut glass salt and pepper shakers for best bantam hen and five chicks.

I had the largest exhibit of White Wyandottes ever made on the Pacific Coast by any one exhibitor. I raise all my birds and keep forty breeding pens and all my hens are trap-nested.

MRS. C. D. HUBBARD, San Fernando.

Starbuck's Barred Plymouth Rocks

We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are laying fine. We have divided into pens according tot the way they are showing up in five months laying. $2.00 for 13 eggs from firs pen. $1.00 from 2nd. until they have time to make longer records. (Except from one best, $30 for 13. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors. ***Wm. Starbuck & Son. Fullerton***

"Queen" Incubators and Brooders

Why pay a big price for an Incubator when you can buy a "Queen" 110-egg size for $11.00 freight paid. There are nearly 80,000 "Queen" Incubators in use giving satisfaction. Every one sold with a 5-year guarantee. It will pay you to see this machine or get catalogue and prices before you buy an Incubator.

The Vegetable Garde

PEPPERS.

In answer to a number of questions on raising chilis, Mr. Lobingier gives an excellent short article on chili culture, so we place it in the garden department. The queries have been so popular lately that that department has been overfilled and some questions have been held over from week to week. The questions are:

What are the best varieties (green and dried) peppers for commercial purposes? How sprout seed? How and when transplant in field? How far apart the rows and how far apart in the rows? What kind of soil is best? Should the soil be very moist when plants are set? How much irrigation will crop require; best location; flat or elevated cultivation? Which are the most profitable, the green or the cured product?—M. J. Golden, Los Angeles.

I take it for granted this correspondent refers solely to the chili or hot class of peppers.

Without question the best variety to grow for commercial use is what is known as the Anaheim chili. It is of local origin and will produce more pounds to a given area than any pepper of its class.

In order to get the plants early in the season, it is necessary to use artificial heat in starting the plants, as all of the pepper tribe are more or less tropical plants and the seed will not germinate in a low temperature.

If one has no greenhouse, a hotbed will answer very well. The second week in March is early enough to attempt to start the seeds. I prefer to sow the seeds in shallow boxes that are, say, 15x24 inches and about three inches deep. Fill these with well prepared soil and sow the seeds in rows across the box. The rows can be about two and one-half or three inches apart. When the plants are a couple of inches high they should be transplanted into similar flats or boxes about two inches apart each way and when three or four inches high they can be set into the open field with almost no loss by being careful to take a small square of soil with each plant. Some growers sow the seeds thinly in rows in the hotbed and transplant from there into the open field which seems to the inexperienced as a great saving of labor. But unless the weather conditions are very favorable there will be more or less loss by plants not bearing the shock of transplanting. They are usually set in rows 30 inches apart and the plants about 18 inches in the row. Sandy, or at least a mellow soil is best. The soil should be in good condition when the plants are put into the open field, and should receive an irrigation as soon as set out. It is difficult to give any set rule as to the irrigation without knowing the soil as well as the locality. The plants will need sufficient water to keep them in vigorous, constant growth, and in some soils and some localities an irrigating every couple of weeks might do, while in other cases it would have to be a little oftener. Like all plants of a tropical nature a warm, mellow soil with abundant water and thorough cultivation will bring best results. I should prefer level culture.

As to the way to market them—green or dried—it would depend somewhat on how good a contract you could get from some factory would buy them green. The ret from the dried product is varia More receive less than $100 per a than get a higher figure.

I know of no crop that would benefited more by careful select of seed and skillful growing chili peppers. In passing throug district where they are grown, if observe carefully you will notice about one out of every four or plants will be two or three times size of the plants around it and p duce two or three times the qu tity of peppers. A grower would follow up his work for a ries of years and give special ca selecting the best peppers from best plants for seed, would s work up a strain that would yi four or five times the crops that average grower gets now.

The curing of chili peppers see like a very simple matter, but un one has had some experience might be well to call in the aid some Mexican of the old school assist in the work. Care must had not to pick the ripe pepp when wet either from dew or rain fog. In localities that have dry the curing is somewhat simplifi but if not accessible to a dryer old method of putting them strings and drying in the sun an is usually followed. Many gro erect a frame and cover it shakes—leaving the sides open— hang the strings of peppers u this roof of shakes until they cured.

The class of peppers known "sweet" peppers—such as the R King and the Chinese Giant— somewhat more profitable if you near to a large city that affords good market for them. They are most altogether used in the fresh green state, and as much as $1 has been taken from two acres. T however, is the exception and no vice nor even the expert can hope equal it very often.—Q. A. L.

CONTROLLING NATURE.

Everybody knows that of l years natural forces have been w derfully subjected to man's ne We are dazzled by the spectac achievements in steam and elec city, but are likely to forget the l noisy but no less marvelous conq of animal and plant life.

Horses are swifter, cattle heav cows give more milk and sheep h finer fleeces than in days gone In plants the transformation is e more marked. People now liv can remember when the number edible fruits and vegetables was less than at present, and even t that could be grown were v inferior to what we now have. example, our parents knew not of the tomato except as a cur ornament in the garden. Sweet c was hardlly better than the com est field sorts. All oranges seeds. Celery was little known poor in quality. In the flower the magnificent pansy has rep the insignificant heart's ease, f which it was developed, and sweet pea in all its dainty sple traces its origin to the common den vegetable.

This progress has been made spite of the great tendency mani ed in all plants and animals to back to the original type. It is, deed, a battle to keep strains p and up to the standard they have ready attained, let alone impr ment. The practical results are complished by man operating lar for love of the work, like Lu Burbank in California, and Eck in England, as well as by the g seed merchants D. M. Ferry & of Detroit, Mich., who are not eternally vigilant to hold what gro has been gained, but have a corp trained specialists backed by an means to conduct new experime The results of their experiences be found in their 1908 Seed ann which they will send free to all plicants.

Queries and Replies

> Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Budding Old 'Cots.

Can I successfully bud or graft Satsuma plums onto good, thrifty, six-year-old apricot trees? If successful. which would you advise, to bud or graft?—Subscriber, Santa Ana.

Satsuma plums will do well on apricot trees. The best way is to cut the tops off after the fruit is picked in July and bud the sprouts as soon as they get to as large as a lead pencil.

Arbor Grapes.

Kindly advise me what is the best kind of grape vines for an arbor. I have some grapes at Redlands that dry up on the vines. What is the matter with them?—Subscriber, Los Angeles.

There are a number of varieties of grapes good for an arbor. Of the American varieties, Niagara, Concord, Agawam and Worden will make a good collection.

Of the other class, Muscatello fino, Golden Queen, Thomson's Seedless, Muscat and Mission will make a good collection.

Your grapes have mildew and should be sulphured once just after the fruit sets and again in about two weeks.
J. W. M.

Which Grape?

As I have been a subscriber for four years and have got many good pointers from your paper, I want your further advice on the best kind of table grape to put on four acres of the very best of heavy soil. I have six acres of Emperors coming three years old. Part of them are on quite sandy soil and part on good light soil, but as I have not found a man that ever saw any in fruiting, I am a little at a loss whether I had better set the four acres spoken of or put it out to Tokay or Black Cornichon, so I will write to you for advice. My land is two miles west of Highland.—John S. Bates, Highland, Cal.

Plant the remaining four acres to Black Cornichon. This variety does well on heavy soil.—J.W.M.

Myrobalan Root, Etc.

Is Myrobalan a satisfactory stock for the apricot on heavy soil?

Which is the better for orange trees grown on adobe soil, Sour or Trifoliata Root?

Where can lime be obtained cheaply and in quantities sufficient to warrant its use in orchard?
—D. C., Orange.

Your nearest point to get lime, we think, would be the Alamitos Sugar Factory. At one time it could be had at 50 cents per ton, to which you would have to add loading and freight.

Myrobalan is a good root for apricot on heavy soils that are not well drained. Sour stock is the best stock for your soil.

Red Spider on Almond Trees.

Will you kindly tell me what to use and when to use spray for red spider on almond trees? J. R. Holland, Lancaster.

An old and reliable remedy is made as follows: Dissolve thirty pounds of whale oil soap in sixty gallons of water. Then boil three pounds of concentrated lye in two gallons of water and as much sulphur as the liquid will carry without settling to the bottom. Spray it onto the trees hot and it will do the work better. Apply in June and September.

Another remedy that holds the red spider in check but not so efficient as the above, is to apply the sulphur dry and with a seed sower on a wagon.
J. W. M.

A Gopher a Minute.

In the Cultivator of January 2, in "Queries and Replies Dept.," your answer to Mr. W. David's question relating to moles, you say, "but don't let a gopher live a minute." I am sure a goodly number of your readers would be glad for your recipe for getting away with a gopher in a minute; in an early number of the Cultivator. C. D. Calkins, Santa Cruz.

Well, our subscriber comes back at us with a hard one, sure. A gopher a minute would be going some, but we don't know but we pretty nearly reached it once. An old ranch was almost as thickly covered with gopher mounds as a wooly dog with fleas, so that trapping was out of the question. We started out in the morning with a tub of potatoes, two bits' worth of raisins, a bottle of powdered strychnine, and a shovel. The potatoes were quartered, or made smaller in some cases, and in each piece a slit was made in which was inserted a little strychnine on the point of the knife. Or a big fat raisin was split and a very small portion of poison placed in center, then closed together like a sandwich. Gopher holes were opened all day and these poisoned morsels inserted each way in the run, then firmly closed.

Whether that day's work averaged one a minute or more we cannot say. After results showed that the number was greatly reduced by emigration or some kind of epidemic. In a potato patch, or possibly in alfalfa, this treatment might not be so effective.

Trapping is sure but slow and requires a little skill and lots of patience. In the poison treatment, allow no poison to be sprinkled on the outside of the potatoes and do not use too much of the poison.

Grapes and Olives.

Will you kindly inform me how to trim the grapevines I mention here—Black Prince, Purple Damascus, Black Ferrara, Black Morocco and Zinfandel? The vines were rooted cuttings set out last spring. Will cuttings taken from a sucker bear grapes? Will vines trimmed up high be less apt to mildew than those trimmed low? How is the best way to sulphur, by putting the sulphur on the vines or on the ground under the vines? In starting olive cuttings what size stalk or limb is best to use? Subscriber, Yuba City.

Prune Black Prince and Black Ferrara, half long; Purple Damascus, long, and Black Morocco and Zinfandel short. We have seen Black Morocco pruned long and over a trellis, but it requires irrigation then.

Vines trimmed any way will not be free from mildew. The best way to sulphur is to use machines that are on the market. There is a bulletin issued from the Berkeley station that gives results of tests. Apply the sulphur in the top and under the leaves.

Olives are started in a commercial way from herbaceous cuttings of two leaves each, but must be grown under glass. Olive trees may be grown

MECHANICAL AGITATOR
Double-Acting Sprayer
With 3-inch brass-lined cylinder, brass-encased outside-packed plunger and brass valves. Large air chamber and long lever. Powerful enough for two leads of hose and four nozzles. Can be placed on end or side of barrel.

Milch Goats.

Since the raid on milch cows and their products my neighbors and myare interested in milk goats, and any information you can give us through the columns of your paper or otherwise will be thankfully received. I would like to hear from parties not interested in sale of stock. I would like to know if goats are subject to tubercolosis and the best breed for milk, the amount they give, length of time they go dry, and especially the best feed if kept confined; also price.

Perhaps you would like to hear of my experience with goats. Thirty-five years ago I was living on an island on the coast of Maine. It was a beautiful island of about 1200 acres largely covered with trees and shrubs natural to the country. I had about 300 sheep that got their living without help, all I had to do was to catch and sheer them once a year.

About this time I read about the Angora goat or Cashmere goat, what a fine, hardy animal it was, with a valuable fleece out of which was made the $1000 cashmere shawls. It set me to thinking. I had been told that every man had one chance in his lifetime to make his fortune and thought perhaps this was mine; so I wrote quite a lengthy letter to the importers of these goats, describing the island, telling about the sheep, etc., and asked what kind of a place it would be for goats. In due course of mail I received quite a lengthy reply praising the goats, telling of their value in clearing land by eating what nothing else would and their fleeces worth a dollar or more per pound, and then said my island would be a "perfect paradise for goats." That capped the climax. I had the goat fever sure, Tongue coated, pulse quick, temperature high! But I read on! The letter closed with "I will sell you a pair of goats for $500, and if you want any extra does will sell them at $200 apiece" I have heard of people being struck by lightning or taking hold of a live wire, but that would not begin with the way that fever left me. I feel it coming on again, but it is in a mild form and will be easily cured—Gilbert Longfellow, Pasadena.

We may be mistaken, but we imagine the milk goat fever may leave the inquirer somewhat as did the other. It seems to be exceedingly hard to get the imported stock, as duties, expressage, and other charges are very great. They may not command $500 a pair, but the cheapest we have heard of were $150 each. The trials of the importer are many and until more of this stock is introduced prices will surely be high. When the offspring of this stock and the better "grades" become plentiful it is probable we may all own goats.

Curing Lemons.

Please inform me through the Cultivator, how to cure and keep lemons through the summer?—Mrs. S. H. B., Reedley.

Lemons may be kept for six or eight months on a commercial scale, by placing them in trays and stacking so as to leave open spaces at one end of the trays, and covering the whole pile with a canvas tent that fits closely to the floor. This is done on a floor with a covering but with open sides. The object is to keep the lemons at an even degree of moisture or dryness. They should not be allowed to sweat or become dry enough to shrink. This is accomplished by raising or lowering the tent according as the lemons show moisture, in which case the tent is raised and when they become dryed off, lower the tent again.

In the case of a few lemons for family use, pick the lemons carefully, not allowing the skin to become bruised in any manner, and lay them away in a picking box in a c place for a week or ten days. If a of them are moist, let them dry and wrap in several thicknesses tough, soft paper and pack snugly a box and place them down cell Examine them carefully now a then and if no mould appears ins of a few weeks, the chances are t you will not be troubled with decay J. W. M.

Sweet and Sour Root.

Will you please tell me throu the Cultivator the difference betw the sour and sweet orange seed plants advertised in the Janu number of your paper? Also g the use of each kind. I shall be v much obliged to you for this inf mation.—Subscriber, Redlands.

The "sweet" orange stock usua designates the seedling plant gro from seed of the California seedl orange, and preferred by many the best stock on which to bud navel or valencia. The "sour" st is a plant grown from seed of wild, bitter or sour fruit grown Florida and some other gulf Sta On moist or heavy soils the la root does better, and is claimed be freer from gum disease. It ma a good stock on which to t Again some growers prefer the melo or grape fruit root on acco of its stronger growth.

A Good List of Table Grapes.

Will you please publish a list the best table grapes and their son of ripening?—G. D. L., Comp

Grapes are divided into three g eral periods as to seasons in wh they ripen. July to August, Sept ber to October and November to cember. Those ripening during first period at Pomona are Ba rossa, (S), Palomino, (L), Blue P uguese, (L), Chasselas Rose, (S), the Sweetwater class, (S).

In the second period are Muscat fino, (HL), Cinsaut, (S), Black voise, (S), Malaga, (HL), Tokay, Muscat, (S), Olivette de Cada (S), Black Prince, (S) and Roso Peru, (S).

In the third period are Verdal, Golden Queen, (L), Cipro N (HL), Black Morocco, (HL) and ple Cornichon, (HL). When th grapes are planted in a viney they will fill up the entire sea and many of them will ripen a the same time. They are all grapes and sell well in the mar The initials after each name i cate how they should be pru long, half long and short. I pruners should be run on trellis not tied to a stake. The trellis give more grapes and the bun will hang free and can be gath without untangling them from stake and thereby spoiling the pearance of the bunches.—J. W.

Cabbage Aphis.

How can I destroy lice on cabb —F. S., Otay.

See article by Prof. Woodw on first page of this issue.

Apricots and Grapes.

I have a moist, sandy loam which I intend to plant to Mu vines, 6x12 feet, apricot trees 24 apart (each tree to take the plac a vine.) Is this land heavy en for apricot trees and if not, w they be successfully grafted on mond?—H. C. F., Tulare.

You had better plant apricot beach root, unless the land is to at certain seasons of the year which case, have your apricot Myrobalan root. Peach roots not endure standing water for

You can. Address Department of Agriculture and request bulletins already printed along those lines, and request that future publications along same line be sent you.

HISTORY OF THE ANGELENO WATERMELON.

This melon I first noticed on a single hill in a field of Chilian watermelons, in 1903. It at once impressed me on account of its brilliant, dark green color and spherical shape, as I did not know whether it was a hybrid or a fixed mutant, I merely saved a few seed and planted them by themselves. The next year in the test it proved a mutant. The following year I planted a little over half an acre, but barely saved enough seed to make another planting, on account of the blight.

The following year I planted a little over a hundred hills on a mountain spur, so as to keep away from the blight, here I secured eighteen pounds of seed. As all my land had the watermelon blight, I last year got others to grow it for me. For my share I secured the seed; that is, they agreed to gather and sell no seed. As soon as the first load arrived on the market, Mr. Musser, president of the Johnson & Musser Seed Company, of Los Angeles, stepped on the wogan and at once looked me up and made a contract for all the seed.

The Angeleno sold at an advance of from fifty to seventy per cent over any other melons.

The growers, according to their statement, made one thousand dollars over and above what they could have secured, had the same field been planted to any other melon. Johnson & Musser Seed Co. have the exclusive right to sell the seed of this melon.—J. C. Ostergard.

IDEAL WATER LIFT.

The writer recently saw in operation in Los Angeles a water lift which is surely novel and has promise of being as effective as it is novel. There are no pump valves nor plungers to get out of order. The scheme is to draw the water by a vacuum created by the explosion of gasoline within the vacuum tank. The explosion can be brought about by the pressing of a button in the kitchen, as by forcing a large head match through an opening within the tank. Then the proper valves are opened when the water promptly rises and fills the tanks on either the first or second floor. It looks too easy to be true, but it certainly works right before your face.

Besides that the system has been placed in actual operation and the Messrs. Cartright & Co., who are Pacific Coast agents show numbers of testimonials of pleased patrons. Among its advantages named are hot and cold water in your house at all times without labor; at a small cost with a simple device; any woman can operate it; a ten-year-old child can operate it; one plant furnishes water from one or more supplies; it brings water from any distance, a mile if you wish; it furnishes water where you wish and at as many stations as you wish; you can have your bathroom and all modern conveniences the same as city residence; it costs practically nothing to maintain. A letter to Cartright & Co. 110, 112 North Los Angeles street, Los Angeles, will bring interesting information.

A GREAT CATALOGUE.

A 360 book is required to catalogue and list the pumps and tools manufactured by the F. E. Myers & Bro. of Ashland, O. And it is not filled with any dead matter, but every page is packed with information and a vast number of illustrations. It's a wonder and an indication that a great firm is behind it.

If interested in pumps write Myers & Bros. and you will get something valuable.

THE OLD HASSAYAMPER.

[The original "Hassayam" poem, written by Andrew M. Ruffner, on the banks of the Hassayampa river, in Western Arizona, in 1871, and set from the original manuscript in the office of the Redland's Citrograph from which we take it.]

He looked at the sky,
  This old Hassayamper;
The weather was dry,
  And he said, "if 'twas damper
Along on the creek,
  I'd run my long tom
And my shovel and pick,"
  Said this old Hassayamper.

The gold in the sand,
  Was the thing that was craved,
But it couldn't be panned,
  So it couldn't be saved
By this old Hassayamper,
  Until there was water
To moisten the pile
  That he'd thrown from its bed
For a terrible while,
  Awaiting the gulch to get damper.

His name at the store,
  Where he got his supplies,
Had been placed on the score
  That was not on the rise,
Just at present;
  But a cloud in the sky
And a breeze from the south,
  Brought a tear to the eye
And the heart to the mouth
  Of this old Hassayamper,
And expressions decidedly pleasant.

But the clouds were dissolved,
  And the showers came not,
While scarce had our hero
  A bean in his pot;
Yet judging from boots and from breeches,
  You would scarcely suppose
He would hanker for those
  For like these are the sobs of the witches.

But our old Hassayamper,
  Without even unfurling the flag of distress
Though so short in his beans and so long in his dress,
  Stayed yet with his claim,
  (As a maiden hath stayed
With a hope that she had
  Till she's adjective mad,)
Awaiting the gulch to get damper.

Ah! where is the hero that's braver than this,
  And where is the hope more encompassed with bliss,
For he sees in the sand as the hope were a truth,
A treasure to gladden the loves of his youth.
The loves of the old Hassayamper.

Had he failed to prepare
  For a season much damper,
The merchant would swear,
  For at last came the floods of a glorious rain
But! Lo, Death had been there
  As they saw by the grave
Of the old Hassayamper.

VARIA IVANOVNA'S VENGEANCE.

AT A cafe in one of the principal boulevards of Paris sat Aleksei Lukitch, a Russian gentleman, twirling his mustaches. He had good reason for self-congratulation. High in favor with the czar, he had long been employed in the work of hunting down certain persons suspected by H. I. M.. He had just followed one of his master's bitterest enemies to Paris, secured his arrest and, by permission of the French government, was off on the morrow to take him to Russia.

A gentleman and lady entered the cafe and glanced at the occupants, and the woman, who was veiled, seeing Lukitch, though he did not notice her, said something to her companion and they took seats directly opposite the Russian. When for the first time he looked at her his eyes rested upon her curiously.

"I will trouble you, m'sieu, to cease your insulting stare," said the woman's companion.

The Russian apologized, but th other grew more and more violen till it was evident that he was i tending to force a quarrel. His l sults came so thick that there w but one recourse for Lukitch—h tossed his card at the man an turned his back. Meanwhile th lady had retired to a distance, an her escort, having produced his ow card, joined her.

* * *

Day was dawning and the bells Paris at a distance were striking th hour of four when two carriage soon followed by a third, drew up a road in the environs and a party from each passed to an open space beside a stream. The man who the night before had forced the quarre advanced to Lukitch and said:

"Permit me, m'sieu, to apologiz for my insulting language last night or, rather, to explain it. Early i the evening a lady asked me to escort her in a round of visits to the restaurants in a search for some on she wished to find. When she saw you she asked me to take the cours I did, promising that the affai should be taken off my hand M'sieu, I have the honor to present your real antagonist."

A figure, smaller than the othe present, who had been standing bac advanced, threw aside a cloak an revealed that she was a woman. Sh was dressed in a tight fitting co tume, with a short skirt, such as girls wear in a gymnasium. The moment Lukitch saw her he started

Varia!" he exclaimed.

"Varia Ivanovna, at your service, Aleksei Lukitch."

"What does this mean?" he asked in a tone that indicated he knew it meant a good deal to him.

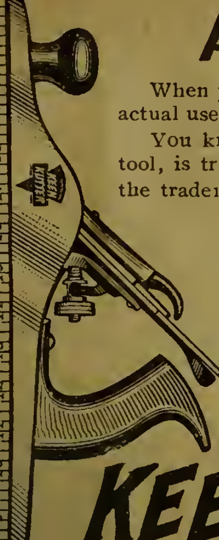
"That the day of vengeance has come."

The others of both parties dr near, intent on this strange turn in the affair. The woman continued:

"You are a faithful servant of your master, Aleksei Lukitch. He rewards you for your service to him it is my part to punish you for yo treachery to me. You made love well, Aleksei, so well that you won my heart. You had fine revolutionary sentiments, so fine that they wor my confidence and I revealed ou purposes to you. Do you see the shrunken cheeks, these premature white hairs? Well, these come fro prison life in Siberia, where you se me. It was during those bitter day in that dark, wintry country that conceived this purpose, and ever day, except when I took part in hunger strike in which we were try ing to end our sufferings by deat I renewed my vow of vengena That vengeance was to have be murder. I have changed it to dea in an honorable way in the eyes the world. On guard!"

The woman spoke as though n for a moment did she doubt the issu of the combat. To her enemy h words seemed prophetic. The han in which he held his sword trembl

Then he saw a throng of wretche creatures, emaciated, starved, co ered with prison filth, white from th shadow in which they lived, gather ing about him and their champio Their eyes glistened as those wolves hungry for his blood. H heard the wind roaring through th Siberian forest now and again inde



A True Plane

When you buy an ordinary plane you have to find out by actual use whether it is true or not.

You know a Keen Kutter Plane, or any Keen Kutter tool, is true before you buy it, because it is stamped with the trademark which guarantees it.

You know it will be perfect in hang, balance, temper, finish and adjustment, because all Keen Kutter Tools are tested and inspected and found worthy to uphold their well-earned reputation as Tools of Service before the name and trademark are stamped upon them. This mark is your safeguard in buying tools. It costs you nothing, but means if anything goes wrong you shall not be the loser. To be sure of lasting, accurate, and practical tools, ask for

KEEN KUTTER

with the shrieks of some prisoner crazed by suffering.

Above this wail came faintly the words "On guard!" spoken sharply by his second to call him to himself. It failed to rouse him. Those looking on wondered. His condition was so pitiful, he seemed such easy prey, that both parties looked to see the woman throw down her sword and give him his life. But she, too, saw in memory the throng of his victims. She saw, too, the handsome fellow that had won her heart for the purpose of betraying her and those whose secrets she had given him. Not one look of womanly pity lighted her face, dark with her own and others revenge.

"On guard!" she cried.

"On guard!" shouted the men of both parties as matadores strive to anger a drooping bull.

Aleksei Lukitch heard and roused himself to die.

A few minutes later the woman threw down her sword and walked quickly to her carriage. She did not shudder; she did not weep. This phase of woman's nature—at least for this one man whom she had killed—had long ago been eliminated. Alone she had come on to the field, and alone she drove way. She had sprung from whence no one knew and went no one knew whither. No angel of vengeance appointed by heaven to avenge sorrows heaped on its suffering children could have struck more mercilessly.—Arline Phillips in Field and Farm.

HOMELY HINTS.

A woman with a spoon can throw
Out of a window more
Than a man with a spade
Can shovel in at the door.

Scraps or "Left-Overs."

To prevent this, save the scraps. This morning I find I had left from yesterday's dinner three slices of steak, a bowl of gravy, plate of potatoes and a dish of corn. I sliced the potatoes, placed on a pan, put the steak on top of them, added salt and pepper, over all poured the gravy, placed in the oven until piping hot, then served on individual dishes.

To the corn I added a well-beaten egg, a little flour, cup of milk, salt and pepper; then fried in hot lard. Do not have the batter too thin.

I took three slices of stale bread, fried a light brown, buttered well, added a little salt; kept hot until I beat three eggs very light; to them I beat in a pint of sweet milk; poured over the bread; then cooked until the eggs were set, cut each slice of bread in two, dished up and covered well with the egg—a nice breakfast dish.

Cold Rice.

If I have cold rice I make croquettes of it by adding an egg, salt, pepper and sweet milk. Have batter very stiff, or sometimes I add the rice to my batter. It is fine in waffles.

To Cook Tough Beef Tender.

Put in kettle with plenty of water, add one large onion, a cup of vinegar, salt and red pepper. Boil slowly several hours. Remove the bones. Put in a crock and weight down. When cold slice and serve, or dip slices in flour and fry in butter. It will keep for days. Use stock for soup.

To bake potatoes quickly pour boiling water over them and boil ten minutes then place in the oven.

Spread stove polish with a paint brush, and shine with a flannel cloth or brush.

Use baking powder can for chopping potatoes for hash or warming over.

Skim milk makes a nice starch for calico cloths.

Dirty wicker chairs and tables are easily cleaned and made to look like new by being scrubbed with salt and water and then set in the sun and air to dry.

Eggs and Poultry.

Eggs have advanced slightly again during the week for fresh stock, and also the receipts are heavy. Storage have gone to pieces and great loss confronts the holders, unless an emergency freight rate can be secured so that they can be reshipped cheaply back to the Middle West from which they came some months ago. This is an indication that California is coming to the point where she will produce her own eggs.

TWENTY-TWO ACRES OF WYANDOTTES.

Grace & Sons, of San Jose, are a new firm to the readers of the Cultivator, but they are not new as breeders of White Wyandottes. In their yards are found many prize winning birds, and birds that have won prizes in the strongest competition on the coast.

Grace & Sons' ranch consists of 22 acres, and they have over 500 White Wyandottes mated up for the coming season's egg trade. However, the egg trade is not the only branch of the business they expect to engage in, for they are preparing to take care of the baby chick trade. Those wanting either eggs or day-old chicks can rest assured that they will get good, healthy, vigorous stock, for the breeding stock has been carefully selected and mated. This, with plenty of free range, insures strong fertility and strong vigorous chicks.

In arrangement of houses for their stock, incubators and brooders, this firm has been very liberal, building good, substantial, well ventilated houses.

They also have a limited number of choice breeding stock for sale; their birds are the true Wyandotte shape; are pure white. If in need of stock or eggs write them, mentioning the Cultivator.

The Sonoma County Farmers' Mutual Fire Insurance Company has just finished a successful year's work and now ranks fourth amongst the mutual insurance companies of the State. During the past year its new business aggregated $581,000 and its total expense was less than $1000. The new board of directors are: Geo. W. Smith, Santa Rosa; A. E Burnham, Dry Creek Valley; Carl Peterson, Alexander Valley; Wm. Evart, Penngrove; A. P. Martin, Two Rock Valley; N. A. Griffith, Vine Hill; John Strong, Bennett Valley; G. N. Sanborn, Sebastopol; J. M. Given, Forestville; S. R. Hill, Windsor; James Sorenson, Petaluma.

Anderson is making a special effort to secure a new creamery.

San Francisco Markets

SAN FRANCISCO, Jan. 21, 1908.

Butter.

Butter is weak with storage going begging. Fresh ranch has advanced a half cent during the week, but full quotations are not always reached.

The current prices on dairy products in San Francisco are always from 2 to 3 cents higher than the rates given in the daily official list of the Wholesale Dairy Produce Exchange. The retail dealers in this city invariably pay an additional 2 cents per pound on butter and per dozen of eggs, and occasionally it is 3 cents. On cheese the increase is 1 cent per pound. By making these additions to the Dairy Exchange prices the producer in the country can always determine the actual prices ruling in this city. The quotations as prepared by the San Francisco Wholesale Dairy Exchange yesterday were as follows:

California extras per lb	34½
California firsts	30
California seconds	22
Eastern extras	24½
Storage Cal ex	24½

Cheese.

California young American fy	15
California flats fy	15
Eastern fy	17½
Oregon fancy	15

Eggs and Poultry.

Cold storage eggs are in a bad way, and prices are being slaughtered. Storage have sold during the week at lower than the quotations now given. And figures below quotations are now ooked at with favor by the seller. It s generally conceded that the dealers underestimated California's capacity o produce eggs.

Fresh ranch eggs	29½

Hay.

There has been a still further diminution in hay shipments during the past week, the total showing 2580 ton in comparison with 3290 for last week and 4040 for the week preceeding that. In spite of this decrease the market is characterized only by a continued dull feeling which, condition will probably not be improved until a general clean-up can be effected, which present shipments will not yet permit.

Coastwise business and a general demand throughout the interior of the State still continue. A large shipment for the U. S. government at Manila, is anticipated within the next few weeks, which will help reduce the surplus city stocks somewhat.

Alfalfa shows some little improvement and No. 1 grade straw is in rather light supply and selling at a fairly good figure in consequence. Our standard grades of hay show no change in prices from the quotations given during the last two or three weeks. We quote today as follows:

Alfalfa local	13.50
Tame oat choice	15.00
Wild oat	10.00@13.00
Wheat and oat	11.00@15.50
Wheat choice	16.50@18.50

Cocoanut cake, per ton	25.00@25.50
Middlings	31.00@32.00

Citrus Market

LOS ANGELES, Jan. 22, 1908,

The orange market is slightly depressed owing to large arrivals at this time. Shipments have been materially decreased and it is thought within a very few days the tone of the market will strengthen. Compared with last year, prices are low, but withall not at all discouraging.

Lemons are stronger and promise to hold, unless large shipments of foreigns now on way shall depress the farther Eastern markets.

Shipments.

Shipments to date are 4691 cars, of which 326 were lemons. Last year same date, 3198, of which 808 were lemons.

NEW YORK, Jan. 20.—Twenty-four cars navels, three lemons and one car Arizona navels sold. Five cars navels sold at late afternoon sale, making twenty-nine cars navels sold.

INVESTIGATIONS OF CABBAGE APHIS.

Continued from First Page.

when it is most needed. There have been a few attempts at controlling natural checks. Ladybirds have been gathered and introduced in large quantities for certain other species of plant lice. No attempt in these cases were made to determine what was actually accomplished, however, and in the instances that have come under my personal observation the results were almost nothing, though the growers were satisfied that the ladybirds had been effective because other conditions intervened which caused the destruction of the lice. Moisture can be secured by irrigation, possibly enough to develop the diseases, but there is no careful observation at hand to show that this is possible. Disease germs may be introduced also, and in the case of the chinch bug in the Mississippi Valley very careful experiments proved that under some conditions such introduction hastened very materially the death of the insect, when the weather became favorable. These, however, are all matters worthy of study and experimentation, but not yet dependable for practical work.

Spraying.

As our knowledge now stands, the sole dependence in the way of remedies is to spray the plants. What spray to use is not a very important question since the insects are very easily killed. Probably a kerosene emulsion or a distillate spray at about half the strength necessary for scale insects would be the cheapest. A soap solution, not stronger than one bar to five gallons, is the most convenient, at least for small growers. The spraying should be thoroughly done, if done at all, for the only insects killed are those actually wetted in the spraying operation. A spray nozzle should be used, giving a rather fan-like spray so that the stream can be directed accurately at the center of the plant, for at the best, some of the lice will escape treatment. The most thorough, careful work can be done at a cost not to exceed ten dollars an acre, and under the best conditions, probably for half that amount. Each grower will have to decide for himself whether in any particular case it will pay to make a treatment. One can afford to make two or three, or even more treatments, rather than lose the greater part of a crop. Probably in most cases one treatment may be enough to give the plants a start and keep them growing until natural conditions arise, unfavorable to the lice.

Fumigation.

The practical impossibility of reaching all the lice with a spray makes the idea of fumigation very attractive. This method is strictly in the experimental stage, however, as applied to field crops, and I regret to say the experiments thus far are not very promising. The cabbage louse appears to be about in the same class as the mealy bug in its resistance to cyanide, and the cabbage plant is rather liable to injury by the gas, perhaps because of the high water content of the leaves. However, it may be that it can be done, though it will certainly be more expensive than spraying. Perhaps it may be more practical for seed bed disinfection than for field work, and probably carbon bisulphide may prove more satisfactory than cyanide, or perhaps no method of fumigation may prove practical.

Dipping.

Every precaution should be taken to prevent the first introduction of lice into the field. In most cases observed this season the insect was without doubt present on the plants when they were set out in the field. A few growers practice the dipping of the plants in soap solution or in kerosene emulsion and in some cases apparently every louse was killed. Spraying the seed bed or dipping the plants before planting are both very inexpensive and certainly should never be neglected.

Cutting Weeds.

The original source of the infectation of cabbage plants in the field and seed beds is the wild vegetation belonging to the same botanical family. That is, mustard and wild radishes. A comparatively small amount of work would enable most growers to destroy such weeds for perhaps a half a mile from their seed beds and he could perhaps in this way produce plants entirely clean from the pest and possibly prevent the infestation of the field until the cabbage has a good start, and avoid the necessity of other measures. Old seed beds should be plowed under, since they are often a prolific source of lice they migrate to the adjacent fields.

Dry weather results in production of winged individuals which fly away and mostly die, but enough usually live to start new colonies on all promising cabbage plants. Remedies are necessary at times because natural checks are not controllable, or at least we have not learned how to efficently control them. The best recommendation is to spray whenever the insects threaten to do greater damage than the cost of the treatment. While spraying is not as thorough as fumigation, the latter method may not be economical. The dipping of plants before planting is recommended if the seed bed is infected, and the general destruction of mustard and wild radish is suggested.

Resume.

The cabbage louse, which is doing such a great amount of damage at the present time in our cabbage fields, is a cosmopolitan insect attacking the various members of the cabbage family. It goes through a series of four stages, the final stage being either a wingless and very prolific insect, or a winged, slower growing, more active and less fertile migrating form. Natural checks preventing it from overwhelming its food plants are beneficial insects, contagious diseases and weather conditions. The first has proven of very little significance; the second, though usually very effective, have also been of minor importance this season, and the last, while not very effective as a direct cause of death in our mild climate, still indirectly is a most important agent. Rains are effective chiefly because they produce conditions favorable to diseases.

Pumped by

The New Pomona Deep Well Pump Head

Pomona Mfg. Co., Pomona

Riverside, Cal., October 8, 1907.

POMONA MANUFACTURING CO., Pomona, Cal.

Gentlemen:—In reply to yours requesting privilege of photographing our pumping plant which you installed for us last spring will say: You are perfectly welcome to take as many photos as you wish, and as our season for pumping is practically over, it may be of interest to you to know something of what we have been doing with it. We have raised forty inches of water about two hundred and fifty feet, delivering it through a six-inch pipe line to our reservoir about one and one-half miles distant from the well. The pump is driven by a forty-horse power electric motor, and our tests have shown the actual horse power used to be twenty-seven horse power. The pump has worked perfectly all through the season and is in perfect condition today. It has come up to all that you represented it and met our every expectation. Should you wish to refer to our plant at any time, you will always find it open for your inspecition. Yours truly,

RIVERSIDE ARTESIA WATER CO.,

The Fruit Grower and the Parcels Post

An Article by Edward Berwick, of Pacific Grove, Read at the State Fruit Growers' Convention

WITH prunes and raisins at 5 cents per pound and canning peaches from $40 to $90 a ton it may be hard to persuade the fruit grower that he wants anything more this side of Paradise. Of course, we must except the extermination of the White Fly and the control of the pear blight. He may feel a little exercised as to the labor question; but, as sales f. o. b. are easy he can afford to let the other fellow worry over the old vexatious transportation troubles. In Los Angeles four years ago the fruit growers were telling quite a different story. We were then as unanimous as Jonah in the belly of the whale that our transportation troubles would be lessened, and our cash in hand materially increased, if Congress would authorize the Postmaster-general to institute an up-to-date parcels post, such as is enjoyed by other civilized countries.

To agitate for this end the Postal Progress League of California was organized. No doubt, many of you have since then read or heard various arguments, favorable or unfavorable, concerning the matter. But lest many of you are not familiar with the parcels post idea, let me briefly inform you of a few of the facts.

Almost all the civilized world regards it as the function of the post office, not only to carry letters but also packages, varying in weight from ounces to hundred weights. Switzerland, for instance, permits the mailing of anything that will pass through the door of a railroad car. Rates are various, but extremely low. Thus Germany, for six cents, within a 46-mile radius, sends eleven pounds, and for twelve cents all through, not only her own domain, but also through Austria-Hungary; a possible 1500 miles. Great Britain sends three pounds to farthest India for 24 cents, or 11 pounds for 72 cents. While we, as you know, pay 64 cents for four pounds from Marysville to Chico. By a curious and ridiculous anomaly this same four-pound parcel can be sent all the way to London, England, for 48 cents, 12 cents less than its cost to Chico; so a suit of clothes can be mailed to Marysville from Dublin in Ireland for less than from San Francisco. At the same time for the British public the American Express Cos. carry all parcels up to 11 pounds from New York to any point in the United States for 24 cents. When an American citizen living in his own country wants to send an 11-pound parcel from Pacific Grove to New York, the same experss cos. charge him $2.35 for the same parcel. You need not suppose that the 24-cent rate is given to the Britisher "because they love him so;" simply, there are dollars in the job for the express cos., even at 24 cents. To help to swell the $30, 000, 000 surpluses of the Wells, Fargo Co., and to make possible the 200 per cent stock dividends of the Adams Express Co.

What these express companies do for the foreigner your post office could do for you.

It seems to me irresistibly comical that retail dealers should oppose a cheaper method of getting goods delivered at their doors. From that time on inspired editorials have appeared continually in the press telling the storekeeper that with parcels post in vogue he would be ruined. Who inspired such editorials, it would be easy to guess. The stuff was even published in San Francisco as telegraphed from New York. And under the guise of opposing the Eastern mail order houses, it gave them a splendid free advertisement. It was alleged that parcels post would throw all business into the hands of the mail order houses, who could, would, and did easily undersell the local trader. On this account merchants, as individuals and in their various associations, were vehemently urged to oppose its institution tooth and nail. Certain jobbers in San Francisco even formed an Anti-Parcels Post League. Their organ was the Pacific Coast Merchant. They feared that the retailer would avail himself of the parcels post to buy his goods direct from the various factories, and so benefit himself and his customers. One such jobber with whom I conversed, after trying the mail-order-house talk, frankly admitted that the parcels post would prove a permanent benefit to the local merchant; but, he claimed, would injure the jobber.

As to why the local dealer should be hurt by a parcels post, no one has yet found out. That the persistent calamity howling of the express companies is already becoming ridiculous and ineffective, the recent endorsement of parcels post by the Society of Retail Merchants of New England loudly attests.

On the face of it, the contention as to injury being worked to the local dealer, bore its own refutation .

The parcels rate asked of the post office was 25 cents for 11 pounds. Now it is safe to say that five-sixths of the population of the United States live within such distance of some large mail order house as to get their goods delivered by freight at a rate much less than this two cents per pound. It is also well known that department stores, even in California, already deliver goods from their bargain counters free of all charge for transportation. In spite of this, I am sure you will all acknowledge that in Stockton, Oakland, Berkeley, Sacramento, and even in Marysville, there were never better stores with finer stocks of goods than there are today. This absolutely free delivery has had no such ruinous effects as have been predicted. Moreover, were the mail order business so exceedinglly profitable it would be easily within the bounds of imagination to conceive of branches of these large mail order houses established at San Francisco, Los Angeles or Sacramento sending their goods by freight to buyers at much lower rates than the advocates of a parcels post have suggested.

And by the by, has it ever occured to the Marysville merchants that they were giving these same mail order houses the biggest kind of a boost by getting the press all over the country to proclaim that goods could be bought cheaper of those houses than of the local dealer? Is it not a direct invitation to any wide-awake buyer to purchase of these houses?

I am glad to be here today, not only to tell them that if this is really their argument it is "bad business;" but also that their whole opposition to the parcels post is, as they are now slowly discovering, also "bad business."

In the first place, the parcels post has proved in other countries a most powerful stimulus to trade. The retail merchants would in those countries be the first to object to its impairment or abolition.

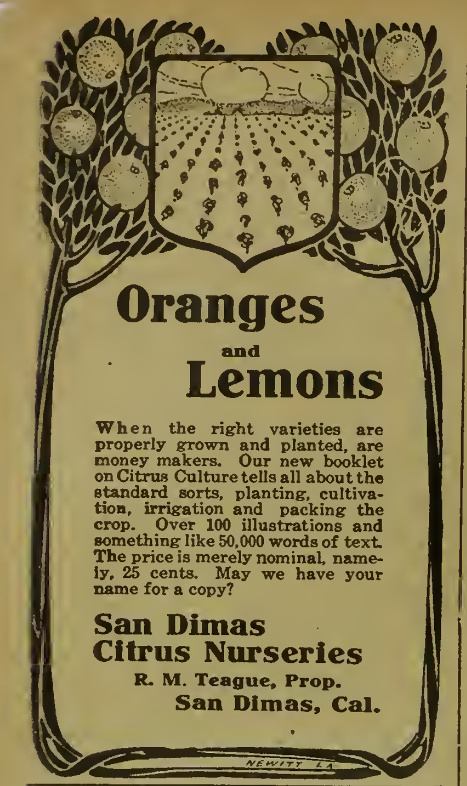
In the second place the lack of a parcels post has been, and is likely to be, the cause of more orders going to mail order houses than otherwise would be the case. Postal rates and express rates on purchases being largely prohibitive, buyers naturally turn to freight rates. To secure these a minimum of one hundred pounds must be paid for. So, if Jones wants only 25 pounds of goods, he suggests to neighbors Smith, Brown and Robinson that they should pool issues, and each send for 25 pounds, dividing the freight charge among them. Jones lends them his mail order catalogue and each selects the goods he needs, and the local dealer thus loses the sale of 100 pounds of goods instead of 25 pounds.

This is the true method of giving the small local merchants a chance to compete with the big houses. It widens his stock and practically multiplies his capital. As to local buyers, there is no doubt they prefer buying things of local dealers, where those dealers understand their business. The average buyer hates to write a letter, or even to fill in an order blank. He wants to see the articles he is to pay for before he parts with his coin. He wants his goods now, and not five or six weeks hence. I am glad, therefore, to learn that those retail merchants who opposed parcels post have reconsidered the matter, and decline any longer to be dupes of the express companies.

Concerning the stale fabrication as to the demand for a parcels post being raised by the Eastern mail order houses, as president of the California Postal Progress League, I can vouch for the fact that not a dollar has reached our treasurer from any one of those houses, and not a single word of encouragement. Of course, if there are individual retailers who choose to cherish the notion that paying exorbitant rates to swell the extravagant dividends of express companies really benefits them and their customers, that is there privilege as citizens of this free Republic. If the experience of the past does not convince them that all improvement of transportation facilities increases commerce, I cannot hope that any argument of mine will avail. He must accept the means at hand to hold his own, and in this struggle with the Eastern mail order houses, the parcels post is the very weapon he wants to aid him in his warfare. By its aid he can stand, if he will only cease telling all the world they can buy cheaper in Chicago than they can of him. The fact of this having been the one stock argument put forward to discredit the parcels post, certainly demonstrates that the express companies and not the merchants, are the real opponents. It is incredible, surely, that any body of intelligent California merchants would be so insane as to spread a report up and down the length and breadth of the land that consumers can profitably send to Chicago for their goods instead of buying at home. I trust our merchants have such abundant good sense as shall lead them to denounce their being any longer made cats' paws to rake out hot chesnuts for the express companies' ravenous maws.

Permit me one word to tell you how British farmers and fruit growers are subserved by the parcels post. By the adoption of packages of size and weight in accord with postal regulations, the British farmer can have his produce taken from his gate by postal motor or wagon,

Continued on Page 127.



Oranges and Lemons

When the right varieties are properly grown and planted, are money makers. Our new booklet on Citrus Culture tells all about the standard sorts, planting, cultivation, irrigation and packing the crop. Over 100 illustrations and something like 50,000 words of text. The price is merely nominal, namely, 25 cents. May we have your name for a copy?

Sour and Sweet Orange Seed Bed Plants
The Finest Lot in California

My sour orange plants are grown from seed off the wild orange trees of Florida. Trees grown on this stock are very desirable for planting in heavy soils or lands that are subject to excessive moisture or drouth. Its most valuable feature is its resistance to gum disease.

My sweet orange plants are grown from seed off very large, old Tahiti seedling trees, thus making the very best foundation to grow an orange orchard on. Don't fail to see my stock before you buy, or address

With the Citrus Growers

PROFESSOR MARLATT ON THE WHITE FLY.

WHILE in California Prof. Marlatt inspected the work of the State Horticultural Commission with the White Fly, anr he reports:

"I was very much interested in the examination of the work done by the State Horticultural Commission at Marysville and have been fully advised as to the work at Bakersfield, and it seems to me that if extermination is possible at all, it will be effected by the measures adopted in these two places. Certainly more thorough work could not well be done except absolute extermination of all arboreal vegetation. The occurrence of the White Flly at and near Oroville, more recently discovered, indicates a much more serious condition, and extermination there seems to be a much more difficult proposition. I have no recent report on the work that is being done at Oroville, but I was advised that fumigation was to be the chief reliance. The outcome, will, of course, depend on the thoroughness of fumigation and the discovery and treatment of every infested plant.

"I confess that the foothold which the White Fly has gained in these three localities in California is a distinct surprise to me. It must be said, however, that California during the last two or three years has had exceptional rainfall, and that the regions where the White Fly has appeared have been rather more favorable for it perhaps than the main citrus districts of Southern California. Nevertheless, it has seemingly demonstrated its ability to maintain itself under conditions of considerable dryness. In Florida the main breeding season of the White Fly is the rainy season of the early spring, and its breeding is much checked during the following period of comparative drought; but even in the dry season in Florida (and the last two years have been charcterized by exceptional drought in that State) the moisture conditions are vastly greater than in any of the citrus fruit districts of California, and grass and low vegetation is even now in Florida, after two years of drought, luxuriant enough. I have not given up, therefore, entirely the belief which I have expressed on former occasions that the White Fly cannot have the menace for California that it has for Florida and other gulf coast States. I do not believe that it can survive the high temperature and excessive dryness which often characterizes Southern California in July and August, sufficient, in fact, to often kill out almost completely the black scale. This argument, however, is not suggested with any idea of abating the least the most earnest effort to stamp out the insect, and your commission is warranted in taking most drastic measures and doing the work in the most thorough and efficient manner. The risk is too great to be lightly ignored."

BEST INVESTED DOLLAR.

I enclose one dollar to renew my subscription to the "Cultivator" for 1908. I always consider this the best invested dollar of the whole year.

I wish you all the success possible.
—Chas. F. Collins, El Modello Fruit Ranch, Dinuba.

GUM DISEASE.

Since our recent article on gum disease we have the following from Horticultural Commissioner S. A. Pease of San Bernardino County:

So much trouble is reported about gum disease of citrus trees in one or other of its forms, that I quote from an article on that subject in Bulletin No. 8 of the Florida Experiment Station, entitled: "The Principal Diseases of Citrus Trees in Florida." Sweet seedling orange trees are partiularly susceptible to Gummosis and sweet orange used as stock for budding remains free from attacks, and in Florida its use for this purpose is almost a sure preventive of this disease.

There appears to be quite a demand here for sour stock on this account. Hence, speaking from our standpoint, those wishing sour stock should procure the seed and raise their stock at home, as we do not admit such stock from any locality that is infested with pests not already here.

MEALY BUG.

Commissioner Pease of San Bernardino sends us the following regarding the Mealy bug:

The Mealy bug (Pseudococcus citri,) is evidently becoming more in evidence each year, and as it has proven very difficult to control I will give some of the reasons from my view point:

The Mealy bug, like the wooly louse of the apple (Schizoneura lanigera,) disappears from the tree tops, and I have found it in the earth on the roots.

This would make it impossible to get it by fumigation at this time. And again, after the females have laid their egg masses, they are so well protected by the cottony excretion, that it would be very difficult to get them all by any of the methods in use. Hence, if these pests are on orange trees I should watch them and as soon as they show in force above the ground and before they have laid their eggs fumigate the trees, using double the dosage and also double time of exposure.

CUTTING GOVERNMENT TREES.

People wishing timber from a National Forest apply to the local forest officer, who goes with them and helps to select the timber. The trees are blazed below the stump line, the height of cutting is marked, and a U. S. brand placed upon the tree. After the cutting is done and the brush piled according to instructions, the forts officer inspects it; and if the cutting and brush piling has been done satisfactorily, he gives leave for the timber to be reomved. In localities where the green timber has been much cut away it may be found necessary to protect the remaining trees, and in such localities the Forest Service is glad to cooperate with the settlers in building roads into other bodies of timber.

The following advertisement appeared in the Matin of Paris: "Can any one give me the names of the aeronauts who passed over the village of Rien at 6 o'clock on Thursday evening and who, by throwing down sand, ruined a freshly-made plum tart? Julie Duplat."—Matin.

California Horticulturally

RAVAGES OF FRUIT FLIES.

ONE of the most serious of all fruit pests is the Fruit Fly. This is not one insect but a vhole family; in fact, members of his group belong to several differnt families, but all are two-winged nsects or true flies. All of these ests lay a number of eggs in one lace and, in hatching, the attacked ruit is infested with a mass of rawling maggots. It is the most isgusting class of all the many fruit ests, but fortunately California is, s yet, wholly free from any member f the class. The well known Morelos orange maggot is in this class, nd is not the only or worst member f it. The olive in Europe harbors a pecies which converts the pulp of ie fruit to a rotten mass. It is not iought less of there, however, for il purposes and olives and maggots o to the crusher together. Ausralia has suffered severely from iese pests, and so bad are they that i some sections fruit growing has ecome unprofitable. There is no nown remedy for them, as they haror within the fruit and cannot be eached with any sprays or washes. or do they confine themselves to iy one class of fruit, but attack all, id there seems to be some species r each variety. Hawaii has sufred severely from these pests and ow it is claimed that they will work i the coffee as well as on other uits. For many years it has been most impractical to grow any memers of the melon family in Hawaii, ther cantaloupes, watermelons or icumbers on their account. The ommercial Advertiser of Honolulu, cently speaking of the damage rought by this pest says that Mr. . G. Irwin, who has made extensive sts of coffee, fruit and vegetable rming on this island, expressed the inion not long ago that the melon was doing more damage than it as blamed for. Most people who ved here fifteen and more years ago e aware of the ruin that came to ir cantaloupe crop when the melon appeared, and everybody knows ow watermelons are suffering. But r. Irwin believes, as a result of his vn observation, that the fly also ings the ripening coffee berry and e immature mango. If this is true may be set down as a serious mece to the future agricultural prosrity of the islands.

Thanks to the vigilance of our ate horticultural quarantine ofers, there is little danger to be apehended of this pest ever getting a othold here.

CE GROWING IN SACRAMENTO VALLEY.

At the Irrigation Convention held Sacramento last September, one of e most attractive features was an hibit of rice made by the State of exas. Rice was there shown in all rms; in various stages of growth; illed and unhulled, and in all variees. It was an object lesson to Calrnia, and many people learned cts about this valuable cereal they d never before known. It now ems that California is to be maralled in the line of rice growing ates with Texas, Georgia, Louisana d the others, for an experiment ong this line conducted by G. G. nshaw, in Glenn county, has oven so satisfactory that it will be llowed up and a large acreage will be sown the coming season. The work this season has been experimental and the whole tract sown covered but sixty acres, of which ten acres were got in too late to give returns, but from the other fifty, twenty sacks per acre were harvested. It is the intention of Mr. Hinshaw to put out 300 acres to rice this season. The United States government, too, is arranging to carry on experiments with rice on alkali lands, and altogether it would seem that rice growing is about to become established in California and another and important industry about to be added to our agriculture.

FRUIT GROWERS' CONVENTION IN THE SOUTH.

At the late Fruit Growers' Convention a resolution was introduced and passed favoring two conventions annually in the place of one. One of these to be held in some one of the Northern counties and the other in the South. In accordance with this resolution Commissioner Jeffrey has already taken under consideration the possibility of holding a Fruit Growers' Convention at an early date, probably April or May in some one of the towns of Southern California.

NEW INSECTARY AT SACRAMENTO.

It has now been definitely decided to permenently establish the State insectary on the capitol grounds in Sacramento. Since the time of the earthquake, this establishment has had no permanent resting place. It was crushed out of existence by the quake, and then temporarily removed to Sacramento, then returned to San Francisco. Now an excellent site has been secured on the capitol grounds, a commodious building will be erected and everything arranged for successful work and the breeding and distribution of beneficial insects will be carried on in a systematic manner under the most favorable conditions.

FORTY ACRES GO UNTAXED.

It is reported that a recent act of the Wisconsin legislature permits the owner of any tract of land in the State to set aside a portion not exceeding forty acres for forest culture to be exempted from taxation on that portion of land for a period of thirty years from the time of tree planting. This also applies to firms and corporations.

This is very good. It might well go farther, and allow an unlimited quantity of land to be thus set aside if security is given that the land will be actually kept in forest until the trees are mature.

PURE WATER ON THE FARM.

Absolutely pure water is not to be found in nature. The amount and the nature of the impurities vary widely, depending upon the source of supply and other conditions. Nor are all of these impurities harmful in a water intended for domestic use (and very few of them may be,) but owing to the fact that water may be the agent for spreading certain diseases, it is essential that care be taken to get a supply that is free from harmful constituents.

Impurities may either be dissolved in the water or carried in supension by it; and they may be of animal, vegetable, or mineral origin. Hardness in water is due to the presence of compounds of lime or magnesia. Iron may be present in quantities large enough to make a water unfit for laundry purposes.

Live Stock and Dairy

COW COMFORT.

THE ordinary dairyman using grade cows will find it pays him well to raise the cows for his own herd. As a rule, the purchasing of grown cows from time to time loads him up with culls, mistakes of everybody's bad breeding. Without he has a regular breeder of cows to buy from, that sells his cows as a crop, he will have hard work to find cows that are good for his purpose. Where feed is not too high in price, the dairyman should raise the calves of his best cows. Around large cities some of the dairymen ship all their heifer calves to outside farmers, who return one-fourth of the fresh heifers each year in payment.

Mixed Comfort.

The heifers or cows under one system of feeding and one strain of blood are more homeogenous in type. A herd whose dams have been fed alike, that are themselves alike, and bred alike, will in their turn feed alike. The fact of unlike feeding is easily demonstrated in any herd. There are in mixed lots always some cows that do not receive enough feed. I have taken cows, that always ate up everything they could reach in the stables to another barn, fed them until they left a little each time. These cows at once increased their production. It then was simply a matter of calculating as to how much these additional pounds of butter cost. These cows often did not return as great a per cent of cash for food consumed as the smaller eaters. While this experiment was not carried out further, yet it was always noticed that the cross bred cow did not pay returns for excessive feeding, they paid on an average ration. The cross bred cows used were Holstein on Jersey and Shorthorn cows. The vigor of these crosses is marvelous and the gross appetite goes with it. It is a pointer to the road to increased vigor. In the human family we know that the Anglo Saxon tenacity crossed on the firey, impetuosity of the Norman made the English race of conquerors. Now when our dairy cattle begin to run out through fineness a cross for one generation on to the more rugged beef stock will bring back stamina, though for one or two generations it will reduce production.

Early Milking.

The proper age to have a cow freshen is about thirty months. Certainly not under twenty-eight or to exceed thirty-two. This age gives the animal a chance to fully mature itself, and it gives the young calf dropped a chance to have some constitution. In a full blood herd there are many heifers that come into milking before they calve. The heifer herd has to be watched on this account. When the udder fills with milk put the heifer into the regular milking string. Then begin to feed her grain until she is on rather richer feed than the mature cow. A little oil cake, half a pound a day, will not be amiss in her feed at this time. It is almost certain to destroy the heifer's value as a milker to attempt to dry her off when the milk once starts to form freely. These heifers make continuous milkers, and they can only be starved out of giving milk. That is a foolish way, for many cows never recover from the effects. I have sold cows of this type that have been ruined by their new owners. These men declared it was cruel to keep a cow in milk so long. Yes, superficially thinking, it may seem cruel, but when a cow has been bred to heavy producing, it is hard to make her go dry. I had at one time ten cows with half udders that I had been foolish enough to persist in drying off. What some of those poor animals suffered. I used to try to help ease their pain, and have stood and cried over them. Anyone that has had a felon can understand what a cow must suffer with a congested udder. A finger after all is nothing like a sensitive udder and teats.

Early Breeding.

The tendency to breed too early is common in California. It is wrong, as it tends to decrease the size of the cow and to lessen her physical vigor. The first year is not apt to be profitable, and the heifer is sacrificed to a mistaken notion that she is wasting time if she is left to mature before taking up her life work of milk making. The government is now considering the safeguarding of the peoples' health as a matter of great importance. The man who has constantly forced his heifers to milk at an early age will have decreased the vigor of his herd until many of them are fit victims for the germs of tuberculosis. The lessened vigor of the cows bring weakness, and with this comes barrenness and all like troubles. The herd will soon become self limiting and die off early.

A Case.

The following is taken from a letter of a correspondent to an Eastern paper. It came from a town not a hundred miles from Los Angeles: "I send you a photograph of a Jersey heifer which was served when five months old." Let us be charitable

ONCE A YEAR NOT OFTEN ENOUGH.

The recent Live Stock Edition of the Cultivator is a strong paper and will bear the closest reading. Once a year is not sufficient to turn out such a special paper and do the service which it should to the stockmen of this State. Men forget too much in a twelvemonth. Give such issues oftener and it will be of mutual benefit to stockmen and your paper. Respectfully yours,

JOHN LYNCH.

Wood Sole Boots and Shoes
We wish to call your attention to the fact that we have a large stock of Wood Sole Boots and Shoes of the very best quality. The Uppers are made of the very best quality Milwaukee Oil Grain. The Soles are well-shaped, and are an exact and comfortable fit, and our ***Patented Fastening*** makes this a ***Waterproof*** Shoe. We all know wood is a non-conductor, consequently it is much drier and a great deal ***warmer*** in Winter. They are lighter than Rubber or Leather Shoes and Boots. Shoes, $2.00; Boots, $3.25.
O. J. Weber Co. 555-557 S. Los Angeles St., Los Angeles, Cal.

The Cream of Cream Separators
The Sharples Dairy Tubular is the cream of cream separators—the pick of the whole bunch. Supply can waist low, you can fill it with one hand. All gears enclosed, dirt free, absolutely self-oiling—no oil holes, no bother—needs only a spoonful of oil once or twice a week—uses same oil over and over. Has twice the skimming force of any other separator—skims twice as clean. Holds world's record for clean skimming.

Bowl so simple you can wash it in 3 minutes—much lighter than others—easier handled. Bowl hung from a single frictionless ball bearing—runs so light you can sit while turning. Only one Tubular—the Sharples. It's modern. Others are old style. Every exclusive Tubular feature an advantage to you, and fully patented. Every Tubular thoroughly tested in factory and sold under unlimited guaranty. Write immediately for catalog J-260 and ask for free copy of our valuable book, "Business Dairying."

enough to hope this was an accident, even if the owner neglects to mention it. It is hard to think that any one could be greedy enough to start this tiny calf into a cow so early in life. Continuing the writer says: "Four months after I found her udder was full of milk. Thinking she had aborted in pasture I commenced milking her, she being such a calf and milking so early. I weighed her milk; I was surprised by her calving on time, proving no aborting, after giving 1500 pounds of milk, testing 5.2 per cent of butter fat." This calf may have gone on all right to cowhood, but what about the future generations? Will it be possible to repeat this year after year and have cows give milk that is full of the life sustaining food for the human family?—M. E. Sherman, Fresno.

FEEDING FARM HORSES.

The common practice is to feed horses unlimited quantities of hay. In some instances the horses are ailing the winter and in the summer the manger is filled to overflowing with hay several times each day. Horsemen frequently wonder why it is with such treatment their horses have a lagging step, a dull eye and a rough coat. On the other hand there are horsemen who feed sparingly, but intelligently, and whose horses, by their action and style, announce at once that they are in the best of condition. In feeding a mature horse the essential thing to be obtained from food given is energy to be used in drawing a load, in walking or trotting. The horse must have enough food to replenish the waste continually occuring in the body and to furnish energy for the work expected. Manifestly, then, one of the first essentials in successful horse feeding is to find the relation between a given amount of food and the required amount of work. Through practical observations and scientific researches the amount of food necessary each day for a working horse has been determined and often published in Field and Farm. These standards tell us how much digestible food is required daily by a horse weighing 1000 pounds when at rest, or at moderate work, or for heavy work. These rations or stanards have been adopted in many countries for army horses and by cab companies having a large number of horses fed under uniform conditions. Practical experience and observation on many of our Western ranches prove that there is much waste in feeding farm horses. We have seen horses weighing from 1200 to 1400 pounds which receive from forty to fifty pounds of hay a day in addition to twelve to fifteen pounds of oats while at ordinary farm work. It is true that most of this food was consumed, but it does not follow that the horse would not have done as well had the food been very materially reduced. During the past several years the amount of hay given to a certain bunch of horses was reduced to one-half the amount ordinarily fed, although the amount of grain remained the same. The horses were not satisfied at first and made their desires for food known every time the feeder went into the stable. However, frequent weighings were made and these weights were used as a guide the amount of hay given to a certain the new method of feeding has been adopted, twenty-five tons of hay a year have been saved. The large draft horses which average 1400 pounds in weight received twenty pounds of hay and ten pounds of grain a day in addition to some succulent food.—Field and Farm.

Deciduous Fruit Culture

SULPHURED FRUIT.

FROM the address of J. L. Mosher of San Jose, delivered at the San Francisco convention of deciduous fruit growers, we quote:

"I have had consideable experience (some twenty-five years) in curing and evaporating fruit—was a member of the State Board of Horticulture for years and during that time conducted many experiments. Have built all kinds of evaporators and spent several thousand dollars in trying to discover a better process than those now in use. I believe this whole sulphuring business has become a gigantic "bug-a-boo," not from the sulphuring alone, but the sulphate of zinc.

"It is and has been the universal custom in evaporating fruit in driers to use galvanized wire trays (that is, iron wire covered with a coating of zinc, and called "galvanized.") The acid of the fruit comes in contact with the galvanizing, which causes an effervescing which dissolves some of the zinc and when evaporated some of it sticks to the fruit and some falls in flakes upon the fruit underneath. Fruit that has been placed on galvanized trays, sulphured and evaporated contains this sulphate of zinc—a deadly poison. Take some of the fruit that has been dried as above and that part that has been in contact with the galvanized wire and draw it across your tongue and you can taste it for half an hour afterwards, a sharp peppery taste, and this substance is certainly detrimental to health.

"My experiments have cost me time and money. For instance, one that will interest you. I have made 2000 trays 2x3 feet, galvanized wire, costing me $1 each. My experiments were mostly with apricots, a very difficult and stubborn fruit to evaporate, strongly aciduous. I found the deposit of galvanizing very pronounced, being easily detected when the fruit was cooked. I also discovered that after using the trays several times the galvanizing was nearly all gone in places, having been dissolved by the acid of the fruit. I also found these flakes of dissolved galvanizing in such quantities that it could be easily scraped up from the bottom of the evaporator. I set my wits to work to overcome this trouble. I took a dozen trays to San Francisco and had W. W. Montague & Co. "Japan" them for me. This was expensive, so they instructed me how to build a brick oven and "Japan" them myself at the ranch. This I did quite satisfactorily at a cost of about twenty-five cents each, $500 for the lot; but I still had trouble, the fruit would stick so tightly to the "Japanning" that it would often come off the tray sticking to the fruit and making it unsalable. My experiments at this time soon culminated in the loss of the whole plant by fire. No insurance. Insurance companies will not insure evaporators.

"Now, Mr. President, I am strongly inclined to believe that this whole matter of sulphur being detrimental to the masses has its origin from the sulphates of galvanizing, and I am positive that all acid fruits dried on galvanized trays are detrimental to health, and yet apples, peaches, etc., have been dried this way for years and shipped all over the world. Now, if we take apricots, cut them open and place them on trays in the sun without sulphuring, they will soon commence to ferment, which causes them to turn dark and the juice will ooze out and turn sour, and when they are dry what have we—a black shriveled up stuff that has a sour wine taste. Place this fruit beside the properly sulphured and dried apricot and see what a difference; cook it also and taste what a difference. So you may see the principal object of sulphur fumes is to stop fermentation.

"Chemists have found slight traces of sulphur. Have they not been testing fruit dried on wire trays? Have the medical faculty pronounced the slight trace of sulphur found in properly dried fruit detrimental. I have been taught from my youth up that sulphur was the best blood medicine in the world for man or beast, and have we not all of us been doped with it by the tablespoonfuls and still live and have good health?

"The fruit growers believe the proper sulphuring the right and only way of curing fruit, but there are some evils that do not meet their views, as follows: Every packing house has sulphuring houses, although they do not dry any fruit. They use these houses for processing certain dried fruit after it has left the fruit growers' and driers' possession. I am not familiar with their methods, but understand the fruit is soaked and then heavily sulphured for the purpose of gaining weight and color. This should be investigated, for herein may be one reason for the cry of too much sulphur, and, if true, should be abolished. Also the drying of fruit on galvanized trays should immediately cease all over the United States.

"Now it has been suggested that our apricots be evaporated by building evaporators and drying them on steam coils. As I have said before, apricots (unlike apples) are a stubborn fruit to evaporate. Can you imagine what an enormous outlay it would rejoice? And then it would not be a success. I know it. I have tried it thoroughly. It is only a suggestion not founded on practical experience. What would we do with our thousands of tons of apricots that must be handled in a few days? Just stop and think. Are we to lose one of the greatest resources that has made California famous? The California apricot finds its way to every known part of the world. It is found on long sea voyages, on the whaling vessels as a preventative of the scurvy; it is found and sought for in the torrid climates, where fever abounds. If more apricots could be sent to the builders of the Panama canal there would be less graves.

"Mr. President, this is a grave and serious question, and the cry of the fruitgrower is, "Give us justice!"

MORE ABOUT SULPHUR.

There are two sides to all questions. The sulphuring of fruit is no exception. Possibily all growers wish that there were some method of curing fruit which might dispense with the use of sulphur and still produce an attractive article of food. That process has never yet been presented, though it is now promised.

A. A. Mills, Anaheim, Cal.

cannot accept promises of a process which they believe to be impracticable, and are free to censure Dr. Wiley for injuring the industry without consideration of its full meaning to the growers.

However, here is a communication from a fruit grower, Paul Thomsen of Aguanga, Riverside Co., which supports Dr. Wiley's position:

In your paper of Jan. 16th, I read the protest of dried friut producers, and as I am a fruit grower myself I am much interested in this matter. I sincerely hope that Dr. Wiley will succeed in devising a method to dry our fruit in such manner as to produce a wholesome and healthful article. I have faith in our government in Washington. I have watched it and studied it and I believe those in charge are trying to do the best for the country. The statement in your paper that it has been proven that it is not only free from harmful effects, but absolutely healthy, I do not believe is correct.

I have gone from store to store when I lived in town trying to find some unsulphured fruit, because I don't like the taste of it. One groceryman told me that he knows it was not good. He had taken pounds of soda because he had ruined his stomach on sulphured fruit; he said there has never been a reform without a fight. I hope the good and true will survive. I have never sulphured any of my fruit yet, but as the most of my trees are young I have only dried on a small scale, and if Dr. Wiley don't succeed in devising some way to dry on a large scale without destroying the fine flavor and healthfulness of the fruit I think I shall.

For the benefit of your readers would you please write to Dr. Wiley and ask him what it is that the sulphur smoke deposits on the fruit and what effect it has on those who eat it?—Paul Thomsen.

No, we did not say that the fruit is absolutely healthy, but did say, "but along this line attention is called to the fact that our sulphured fruits shipped into the German markets and at first denied admittance were afterwards admitted because it was conclusively shown that they were perfectly healthful."

We did not add, but might have done so, that the German government is extremely careful in its examinations of imported food stuffs, and we do not believe it would ever have admitted California sulphured fruit unless it was proven healthful.

Now, all growers are anxious for improved methods, and whether from Dr. Wiley or the writer of the above letter, any such improvement will be received with open arms. But as shown by another writer in this issue, it will not be the first effort to devise such method by any means. But until such improvement is presented, fruit growers who have invested their all should not be ruined.

The question which Mr. Thomsen wishes us to ask Dr. Wiley is answered in Circular 37 of the Bureau of Chemistry, Department of Agriculture, and can be had by writing to Washington. Its full title is "General Results of the Investigation Showing the Effect of Sulpurous Acid and Sulphites Upon Digestion and Health," and it is by H. W. Wiley, Chicf of Bureau of Chemistry.

Rialto fruit growers are having trouble with the supervisors of the county who threaten removal of trees which are not on the proper line along the street. The growers desire the trees to be kept because of their value as wind breaks.

The rainfall at Healdsburg to date amounts to 12.04 as against 19.18 last year.

FERTILIZING GRAPES.

In a preliminary report published in "Revue Viticole" regarding some experiments in the fertilization of grape vines, there are some interesting facts which are at least suggestive to the California grape grower. The report covers three years of experimental work, and Professor Verdie who has had the experiments in charge, finally draws the conclusion that he favors a combined fertilizer for vineyards located on a sandy, non-calcareous soil, consisting of one part dried blood, two parts sulphate of potash, eight parts basic slag and four parts gypsum. He reacnes the interesting conclusion that growers are warranted in using chemical fertilizers in the manuring of vines for the production of high grade wines. Although nitrogen increased the vigor of the vines where the amount used was large, the quality of them must appear to be less rich than in plants where the nitrogen content was small. The writer states his belief that potash has a decided influence on the quality of the fruit and must, and recommends the use of the complete fertilizer indicated above, including the gypsum. If we apply this recommendation to the California conditions where very many of our vineyards are located upon sandy soils, it will probably be unnecessary to apply the gypsum on account of the highly calareous nature of these soils. Still there is good reason to consider it as worth trying, because the gypsum has a marked influence in rendering plant food available. We may suggest as an experiment, the applicatin of 100 pounds of dried blood, 200 pounds sulphate of potash, 300 pounds Thomas phosphate and 400 pounds of gypsum to the acre.

The grape is a crop which is likely to show good results from the use of potash. It is a gross feeder on this side of plant food. As compared with citrus fruits, it removes at least a fourth more potash, a half more phosphoric acid and only about half as much nitrogen. While the nitrogen may be added to the vineyard by the use of leguminous crops to be turned under, it is possible to add the mineral fertilizers, potash and phosphoric acid in no other way than by direct application.

As to whether it is or not best to use commercial fertilizers, it may be said that this cannot always be determined from a soil analysis. The question may be reduced to a practical commercial one, viz.: Can we produce enough important products to pay for the added cost of the plant food and labor, leaving a surplus for profit? If we can determine this to be the case by experiment, then it matters not what may be the soil composition; it will pay to use the fertilizer to form a growth and crop within the limit of safety and of health of the plant.

As to the use of nitrogenous matter for the grape, it may be said that stable manure is not generally looked upon with much favor, as it is said to induce fungus attacks by weakening the vitality of the plant. Much better results can be had by the growing of legumes and crops between the rows and encouraging the larger growth of such crops by the additions of potash and phosphoric acid. By such a system the vineyardist not only adds to the store of plant food in his soil, but at the same time vastly improves its physical condition.—George Wright.

ROEDING
TRUE TREES
FRESNO, CAL.

TREES

Place Your Orders Now

Any tree can be labeled, but to have that label true requires care and experience. Our trees are backed by our reputation and 25 years experience. They are all strong and thrifty, with well developed roots and every one true to name. Our nurseries comprise over 1500 acres in the most favorable and fertile spot in California. We are the largest growers and shippers on the coast.

Here are a few suggestions for planters.

Plums Prunes

You can make no mistake in planting Climax, Kelsey Japan, Wickson Plums, Sugar Tragedy, Hungarian Prunes. We have them grafted on peach and Myrobolan roots. Excellent profit can be made through Eastern shipping.

Almonds

We have a large stock and are offering them at low prices. There is money in almonds. The Hatch varieties sold for 14c to 18c a pound this year. We can now supply Texas Prolific, the frost proof variety. Try a few trees.

Walnuts

You will make no mistake in planting such types as Placentia Perfection, Franquette, Mayette Rouge, Parisienne in grafted trees. They come into bearing in half the time of seedling trees.

Apricots

Brought a very high price this year. The old standard sorts Blenheim, Hemskirke, Tilton and Routier's Peach are the popular varieties.

Peaches

We will supply you with Muir, Lovell and other freestone peaches at very low prices. Superior trees for profitable planting.

Olives Figs
Oranges Lemons
Grape Vines Berry Plants
Etc.

All of the standard sorts

LET US HELP EACH OTHER.

The aim of the Cultivator is to advance those things which are of most importance to the agricultural interests of the State. To that end it is constantly advocating best plans and the best way to work out those plans. We need so many things in this great and growing commonwealth; the question is, how shall they be obtained? Now, the Cultivator can and will bend its efforts to advance every interest which affects the farmer. It has a great constituency of readers, over 12,000 weekly, and it is in the eyes of the men who frame the laws and do things in California. But to accomplish the results desired takes time work and money, and they can be accomplished only when we are supported by the intelligent thought and earnest efforts of the best element. We ask this support on the ground of merit and shall make every effort to give full value for such support. This support can be made effective by our readers in making an active campaign for us. We want a continually growing subscription list, and our friends can do more effective work for us than we can for ourselves. The results of some of our campaigns are well known, and appreciation of them is shown on every hand. In supporting us our readers are supporting their own cause. We need markets. We need home markets. The markets we most need are to be right at our doors. We need manufacturing enterprises. If we are ever successfully to diversify our productions we must have the markets in which to sell the products.

We need an awakening on the part of the farmers to the value of our Farmers' Institutes. Professors Neff, in Southern California, and Clarke, in the northern half of the State, are doing splendid service in this work, but they need heartier support. They need more money for institute work. Prof. Wickson is zealous in his endeavor to promote the agricultural college, but he stands in need of a greater appropriation to do those things which are absolutely essential to be done right away.

And we need good roads. "Lord, how we need 'em." We must have good roads. Every farmer needs a good road to his town market. He is entitled to have this, and as the Cultivator has said dozens of times, and its editor on many public occasions, at farmers' institutes, we want him to demand this. He should repeat his demands in terms so emphatic that the Legislature of the State will sit up and take notice of his appeals. He should be satisfied with nothing less, and he should voice his dissatisfaction until he gets what he is entitled to along this line. Now, the Cultivator is behind the good roads movement. It started the campaign five years ago, and it doesn't propose to cease its efforts until good roads are a feature of the industrial work of California. But it needs the backing of the people. It cannot accomplish the work alone. It must have assistance. The larger the circulation of the paper the greater will be its influence. That is why we want every reader of the Cultivator to help us extend its membership.

Will you do this? Help us. We'll help you.

AN OPENING FOR YOUNG MEN.

Coming from the East a young man often finds it difficult to obtain the kind of employment he desires. If he has been a resident of the Middle West he is used to large farms and his crops have been corn, oats, hay, cattle and hogs. There he was used to farming on a big scale and when he looks around and sees ten and twenty acre ranches he naturally wonders how people make a living on so small a parcel of ground.

We are often asked by young men where to find the best opening in the line of farm wark in California. Our answer is in the market gardening business. With ten acres of land a man can find as much work and take off as much crop, measured in dollars, as he can from a hundred acres back east. One will hardly believe this until he has made the experiment. If he has farmed intelligently, produced what his local market demands, he will find that his labor brings him in a satisfactory revenue.

Almost any hustling young man can raise the money to rent or even make a purchase payment on ten acres, and with a little cash for tools and seeds he is ready to go ahead. It may seem at first that gardening as a business is overcrowded, but remember that there is always sale for first-class stuff and that is what you must endeavor to produce If you have the right kind of stuff you will never lack for buyers. In most localities not half of the farmers grow enough garden for their own use. They have a little early stuff, but for onions and late cabbage and sweet potatoes and even Irish potatoes they depend on the gardeners near town. In many places, even where there is no town trade, a man can do well on his farmer trade.

The growth in population, of California, is so great there is no danger of overdoing the market garden business for many years to come. Almost the whole country will soon be suburban towns and in view of this young men can never go wrong when they engage in the lucrative employment of market gardening. We know two women who are working five acres on a rental proposition who last year cleared more money than they could have cleared tending school. They were out of health when they went into the business, today they are strong and consequently happy. They got well from tho outdoor exercise.

IT'S UP TO THE FARMER.

There is an effort being made by the forces which make for good in this State to incite the agricultural classes to a greater appreciation of their opportunities. We may embrace in this class of workers the State Agricultural College, the weekly and monthly periodicals whose energies are devoted to bettering conditions among farmers, the Farmers' Institute workers and the up-to-date agriculturist who is anxious that his neighbor shall make the best use of his time and circumstances, to the end that he may advance his own interests and increase the productive power of the soil. California possesses a wonderful climate, a soil of unsurpassed fertility, markets at easy command, and all the water needed to mature whatever crop is desired, and yet no one believes, or affects to believe, we have more than superficially entered on the domain of agricultural science. In short, we are not beginning to make the best use of our advantages.

There are many intelligent, progressive farmers in this State and they are making a splendid success of their endeavors. But likewise there are many who are not. They are indolent, shiftless, non-progressive, will not read farm papers nor take any interest in their work. Such men are a detriment to the State and to the community in which they live. It is these—the careless and indifferent, the slothful and ignorant, who need to have awakened in them a strong and enthusiastic faith in agriculture and an assurance that there is no profession that gives better returns for the brawn and brain invested. It is these who the progressive farmers must help to reach and help to educate to take pride in their calling. This can be done by encouraging them to read good farm papers, to attend the Farmers' Institutes and to think along lines of improvement.

California is capable of feeding the United States alone if the possibilities of its soil and climate were fairly understood and worked out to their limit. If we can, by a proper understanding of our resources, raise twice or thrice what we do today, we shall be that much richer and at a minimum expense of time and labor. Yes, the future of agriculture in this State is up to the farmer alone.

Prof. Wickson of the State University has issued a statement in which he scorns the position of Dr. Wiley of the Department of Agriculture, and maintains that the salt process recommended for curing dried fruit, is of no value. The Cultivator will give more space to the letter next week.

Shop Talk

AGENTS—A short time ago we stated in this column that most of our traveling agents had been withdrawn. We did not say that we had abandoned entirely this method of making our collections, and in some sections we still have some agents at work. We will say, however, that any who may call upon you will be able to show his authority to represent us.

Will also add that in those sections where an agent is not working, or is not soon to work, we will mail notices from this office, and you will understand that you must remit direct to us.

We think it well to make this anouncement so all will understand that if you receive no notice you may expect an agent to make collection before very long.

We would call attention again this week to the book which answers the **500 HOG QUESTIONS** and which is advertised on page 122.

Our readers seemed to appreciate the recent offer which we made, so we will continue it a while longer.

To those remitting on their subscription account, and paying an entire year in advance, we will, on request, order the book mailed to them. The remittance must come direct to the office and must pay an entire year in advance.

FAVORABLE COMMENT.

E. B., Mecca, says: "I don't see where I could suggest any improvement in the Cultivator. The hints I have received from reading your paper has many times covered the subscription price."

G. W. C., of Santa Maria, says: "Please send the Cultivator along. I do not want it to stop for it is the best paper in the State of its kind."

C. W. C., of Fresno, California, says: "I am well pleased with the Cultivator. I do not wish to flatter tho management of the paper, but its equal is not published on the coast. I am one of the Cultivator's first subscribers here and would not do without it."

Agricultural Notes of the Pacific Coast

Northern California

Petaluma has a new incubator facory.

Anderson offers a fine opening for a reamery.

Sonoma county reports less pear light than last year.

The premium list of the Cloverdale itrus Fair has been issued.

Bennett valley Grange will have a eap year ball February 8th.

The acreage of beet planting in hico will be greatly enlarged.

The Republican State Convention vill be held in Sacramento May 14 .

Farmers of Placer county are sowng an immense amount of grain.

Gridley fruit growers will plant xtensively of almonds during this eason.

Soil expert Mackie of the departnent is making investigations at ridley.

Sacramento valley will make an exibition of its products at the Alaska-ukon Exposition.

The Northside Irrigation Company s making surveys for a canal to carry vater to Henleyville.

Three carloads of creamery mahinery have been received at the new tate Farm at Davis.

Anderson shipped two carloads of ops last week the price ranging rom 3 3-4 to 5 1-2 cents.

Extensive experiments will be made his season at Woodland in the pickng of hops by machinery.

State Horticultural Commissioner, effrey, recently addressed a comany of fruit growers at Yreka.

Stockmen near Yreka are rejoicing ver the mild season which has alowed better range for cattle than sual.

C. L. Marlatt, of the Bureau of Enomology, has highly commended the tate Horticultural Commission for e very effective work in the control f the White Fly.

State Commissioner Jeffrey, has reorted that of the fruit and trees reeived at San Francisco during the st year, fifteen and one-half per ent were destroyed because of disase or pests.

At a meeting of the sheepmen of e State at the Sacramento Chamer of Commerce, the organization of e California Wool Growers' Associaon was effected. C. A. Kimball, of anford was elected president and A. . Elseon was elected secretary, and e executive committee was as folows: Henry Glide, of Sacramento, . L. McCoy of Red Bluff, J. H. Hoyt f Suisun, T. H. Giarnella of Honcut, . Bullard of Woodland.

Petaluma grange recently installed fficers as follows: Worthy Master, . M. Winans; overseer, J. W. Mcally; lecturer, Mrs. Ella Cameron; teward, Mary E. Winans; assistant teward, Frank O'Conner; chaplain, rs. Eliza E. Grover; treasurer, race E. Bennett; secretary, M. Ella cPhail; gatekeeper, J. Rodenhurst; omona, Miss Alice Kelsey; Flora, iss Edith Squires; Ceres, Mrs. A. . Hall; lady assistant steward, Miss assie McGlynn; pianist, Miss Nellie rover; trustee for 3 years, A. S. all.

Central California

Delano grain prospects are good.

Japanese are leasing quantities of land near Watsonville.

San Jose Grange is making a strong fight against the sulphur ruling.

Salinas is anticipating a reservoir, the dam for which will cost nearly $300,000.

Wheat growing is giving way over the San Joaquin valley to barley growing.

A permanent organization of fruit growers has been effected at Hollister.

Livingston, Merced county, will plant about 3000 acres of grape vines this year.

San Benito proposes to be one of the greatest egg shipping centers of this State.

W. H. Volck, commissioner for Santa Cruz county, hopes he has a remedy for the Tussock moth.

Impetus to irrigation of the mountain valleys near Tehachepi has been given by the discovery of wells in that section.

A bulb company at Santa Cruz has shipped large quantities of Paper-white narcissus and daffodils to Los Angeles and other large markets.

C. H. Shinn attended the meeting of stock growers at Fresno recently and assured them every possible privilege would be extended in grazing permits.

The Central California Produce Company has been organized at Turlock. It will conduct the business of packing and shipping the fruit of its members.

Thousands of wild geese have invaded the grain fields at Angiola, in Tulare county, and done great damage. One farmer with his two sons destroyed 118 of the fowls in a single forenoon.

A good flow of artesian water has been developed on a ranch on the west side of the San Joaquin valley about 20 miles west of the city of Hanford. This will be a great advantage to that section, which is known to be very fertile but lacking in water.

A Santa Rosa fruit grower who has sold to Guggenhime Company had its fruit accepted and paid for, but later after shipping to San Francisco, it was objected to because improperly cured. It was then returned to the grower and suit begun against him for the money paid. The court has decreed that the purchasing firm cannot recover money from the grower as fruit should have been objected to when first purchased.

The Tulare Grange has elected the following officers for the ensuing term: J. T. Lawrence, W. M.; C. A. Henry, overseer; John Tuohy, lecturer; F. H. Styles, steward; A. J. Woads, assistant steward; Elsie Fay, chaplain; George Watts, treasurer; Bertha I. Morris, secretary; Hy Hunsaker, G. E.; Fannie Way, Pomona, Ada Griffith, Flora, Emma Lowman, Ceres, Mrs. E. B. Lawson, L. A. S.; Mrs. F. H. Styles, organist. The installation was conducted by retiring Worthy Master F. H. Styles, assisted by Past Worthy Master Miss A. O. Swanson.

Southern California

Orange picking has been stopped by the recent rains.

The Redlands olive works are running on pickles and oil both night and day.

Hemet ranchers are plowing and putting in grain to a greater extent than usual.

Riverside has shipped about 700 cars of citrus fruits of which nearly 100 are lemons.

The growing of beans will be one of the industries of Imperial valley the coming season.

Farmers near Thermal, Riverside county, are growing some good samples of sugar beets.

D. G. Aplin is president and E. R. Baker secretary of Water Company No. 1, Imperial valley.

Mill Creek Canyon is to have a large number of new trails to aid forest rangers in their work.

Four species of pines are being planted at the Lytle Creek Canyon, National Forestry Nursery.

Three thousand acres of eucalyptus will be planted on the Bixby ranch near Long Beach this year.

Los Angeles has secured the next National Live Stock Association Convention, to be held in January, 1909.

Boyle Heights, Los Angeles, is to have the honor of securing the first tree-lined boulevard under the State Tree Planting Act.

A large New York fruit buyer says that no fruit shippers in the world equal California orange packers in a tasty fruit packages.

Orange growers say that this has been the most favorable season for maturing fine oranges ever granted to Southern California.

The orange growers of Southern California have been made happy this year by having plenty of refrigerator cars for shipping of oranges.

A legal battle for the control of the great watershed on the desert side of the San Bernardino mountains is on between the Westwater Power & Water Company and the Arrowhead Power & Water Company.

The company owning the salt works which were destroyed by the break in the Colorado river, filling the Salton Sea, has been awarded $450,000 in its damage suit against the California Development Company.

Indio is making a trial planting of 75 Pistachio trees, which have been sent to the Government Experimental Station. The nuts from these trees sell in the open market at from $1.00 to $1.25 a pound, it is claimed.

Lemons are giving a remarkable growth this season owing to the favorable conditions prevailing, the weather at no time being cold so that young fruit, often blasted by the cold nights, has continued to gow and mature.

E. L. Goodsell, of the large fruit auction company of New York, visiting in Riverside, says that the quality of Florida oranges this year has not been equal to those of the past, while those in California have been greatly increased. Mr. Goodsell of New York city will yet handle 100 cars of California oranges.

The Coast

A beet sugar factory is to be erected at Los Vegas the coming season.

Oregon is to provide $150,000 to aid in irrigation movements the coming year.

A vetch grower in Oregon produced $800 worth of seed on 16 acres last year.

Some sales of hops at Salem, Oregon, have been made at 10 and 11 cents.

The Colorado Grain & Seed Growers' Association met in Denver last week.

Fruit growers at North Yakima are petitioning for a horticultural inspector.

Hog cholera has broken out in Palouse, Washington, and is doing much damage.

The creamery at Dillon, Montana, has closed because of want of cows in that section.

In less than a week 300,000 bushels of wheat were sold at Walla Walla, Washington.

Wheelan, Washington, has reorganized its grange which has been dead for several years.

The Polk County Mohair Association held a show at Dallas, Oregon, January 16th 18th.

The finest exhibit of apples was made at the State Fruit Growers' Convention at Oregon.

The prices of onions have advanced in Seattle, and it is said the market is fairly well cleaned up.

The Oregon State Poultry Association closed its thirteenth annual show most successfully last week.

White farm hands have combined and driven Greeks and Japanese from the neighborhood of Boise, Idaho.

The annual meeting of the Washington State Horticultural Society is being held in Walla Walla this week.

Utah had the most successful farmers' school at its State Agricultural College which it has held in its history.

The town of Toppenish, Washington, which formerly shipped 10,000 "cayuses" a year, shipped only 500 last year.

Fruit growers at Medford claim that the Rogue river valley will soon be sending 400 train loads of apples to market.

The Lane County Fruit & Vegetable Growers' Association has been organized at Eugene, Oregon. It will market fruit and vegetables.

A large representation of "dry farmers" met in convention at Salt Lake City last week, and discussed the various methods of dry culture.

Vetch growers at Tangent, Oregon, have formed a vetch growers' union. This union has advanced the price of vetch seed from $1.25 to $3.25 per hundred.

Shippers of the better grade apples from the Oregon apple sections are complaining because the scarcity has caused the shipment of inferior fruit this year.

The fruit growers of the Northwest have complained bitterly over the rejection of prunes during the past season. Over thirty cars have been rejected because of moldy fruit.

The Ornamental Garden

THE ROYAL WALNUT.

I WAS glad to see the Cultivator thought the introduction of the Royal walnut of sufficient interest to warrant the reproduction of the photograph of the original tree in a recent issue.

A tree that will grow one hundred feet high and three feet through the trunk at three feet from the ground in sixteen years, and having the great economic value that belongs to the black walnut everywhere, is certain to become an important factor in the forestry problem of the future.

Probably no timber tree in this country has the value in dollars and cents that belongs to the black walnut, and the area over which it will flourish is so vast and the ease with which it can be grown so great, that I judge that very few can fully comprehend the possibilities that attach to the introduction of this hybrid—I can attest to its rapid growth.

In the spring of 1905 I procured one pound of nuts from Mr. Burbank and planted them as soon as I received them. I wanted a few large growing, handsome deciduous trees on the south side of my dwelling, that I might have shade in the summer and the sunlight in winter.

Among others, I planted two of the Royal walnut, and I submit herewith a photograph of one of these seedlings, taken in October, 1907. This tree is three inches in diameter one foot from the ground and the man in the picture is 5 feet 10. So you may determine the height yourself. This tree has been grown without irrigation and considering that the walnut takes the first three years to make roots and get ready to grow, I look for a wonderful growth in the next few years. To test its value as a stock for the English walnut, I grafted one seedling with a soft shell and the union proved absolutely perfect. I have yet four fine well shaped seedlings, that I will top graft this coming spring with soft shells.

Royal Black Walnut seed planted in Spring of 1905. Mr. Lobingier standing by tree.

I found some variation in the vigor of growth in this lot of seedlings, but not as much as is usually found in seedlings. In large plantings for forest, it will of course be necessary to use seedlings; but he will be wise who will procure a tree or two grafted from the original tree, from which to grow nuts for future planting.—Q. A. Lobingier.

Only One "BROMO QUININE"
That is LAXATIVE BROMO QUININE. Look for the signature of E. W. GROVE. Used the World over to Cure a Cold in one day. 25c

THE CANNA.

Deep planting will often be sufficient as the stalk has the support of the soil around it. Good, rich, sandy loam and plenty of water are required. As soon as the spikes get to blooming well they may be cut and put in water when they will continue to grow and bloom as well as in the ground.

The canna in the large sorts is very pretty and showy. For tropical effect we have few plants that equal it. The large flowered sorts, as "Alleniani," "Italiafi," "Austria," "Burbank," "Philadelphia," "Pennsylvania," and others are exceedingly fine. The foliage is in different colors, so one can have quite a variety.

Cannas should be planted somewhere in the background, for they grow so rank they hide other things. Their blooms are rather coarse, too, so they do not combine well with other flowers, or do well for cut flowers unless used in large bouquets and with large ferns or leaves. Nature shows this by giving the plant large leaves and tall stems.

Do not let them go to seed if you want a long season of bloom. The old bare stems left after the bloom falls looks ragged and bad, and should be cut out at the ends. Do not cut out the whole stalk, for it will send out a blooming branch from each joint until the whole stalk is exhausted. Then it, too, should be cut out.

A GARDEN SEAT.

If you are cutting down trees in the yard save two stumps which are close together for the purpose of making a substantial basis for a garden seat, or, if you desire, have two large pieces cut and put in the place where you wish this seat. Cover it with a large flat board for a seat, make a suitable rustic back and arms. If desired, the grape vines can be interwoven through the back and arms, and over it can be grown pretty trailing vines. This is a good idea for country people who have an abundance of room for just such benches, which adds so attractively to their spacious lawns.

"A VERY GOOD JOURNAL YOU'D SEE."

(Written for California Cultivator by Katie R. Gilstrap.)

If you a very good farmer would be,
Just take the Cultivator.
And then a very good journal you'd see,
It's a right good educator.

It has this, and that, and the other too;
Many things you'd like to know.
It has homely hints, how to cook and stew,
And tells you how to plant and grow.

There's many "ads" that ask your "dough"
But when you well have hunted
We think you surely "why" will know,
Your runted pig was stunted.

So many notes from the Pacific Coast;
All tell of great achievements,
And all must surely see, just cause to boast
Of many grand attainments.

If you should think of things you do not know
Just ask the Cultivator.
And then read all their pithy points, and lo!
Your ignorance will scatter.

If sickly, weak or lousy hens don't pay,
Then see just what's the matter
By reading the many good things they say
In the helpful Cultivator.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

BLACK HEAD, A DISEASE OF TURKEYS.

THERE has just been received at the school a bulletin published by th Rhode Island Agricultural Experiment Station entitled: "The care and management of turkeys with special reference to the 'Blackhead' disease."

The above station deserves a great deal of credit for the work it has done in investigating this disease; the work will be of great value to our poultrymen throughout the country, and more especially to the farmer who is raising turkeys on a small scale.

Several cases of "blackhead" were reported to the school last year during the spring and summer months, and are the only cases the writer has come in contact with; it is possible, however, that numerous turkeys have been lost throughout the State by this disease, the raiser not knowing the cause of death.

There are numerous localities where turkeys have been raised successfully for a number of years; then there appears an "off year" as the farmer calls it, when a great many of the poults are lost, and from that time on there is trouble in raising the young turkeys. The cause being, no doubt, the "blackhead disease," the parasite having been carried to the flock in some way.

Symptoms.

Although the term "blackhead" has been applied to poults dying of amebic disease, experience has shown that few young poults have black heads when they die, and that many old turkeys do not. When turkeys, after a long continued illness die, their heads, which are usually red in health, become more or less darkened. In acute cases they die so quickly, however, as to leave no impression as to a change of color of the head.

The majority of young poults die after a day or two of droopiness. Adults may droop longer and pass into chronic stages of the disease. Refusal to eat and standing apart constitutes late symptoms. Starvation in chronic cases produces thinness. When the disease in the cecum is slight it is doubtful if the affected birds have diarrhea, which is more or less present in other cases. In many of the older poults the droppings will be liquid and stained orange yellow; this is the most characteristic of all; sometimes there are blackened blood clots in the droppings, indicating slight hemorrhages. Most affected turkeys die during storms: their circulation seems deficient and unable to carry them through the severe changes. When they are noticed in time and are dieted in confinement of a colony house, many may convalesce that would otherwise die from exposure.

The following is a summary of the bulletin:

Summary.

Before these experiments were begun at the Rhode Island Station, it had been shown by Dr. Theobald Smith, then of the Department of Animal Industry of the U. S. Department of Agriculture, while engaged in co-operative work between the Bureau and the above station, that the disease of turkeys, commonly called "blackhead" was due to a minute animal or protozoan.

The seat of the disease was shown by Smith to be in the liver and ceca. In the former it is recognizable by discolorations often more or less circular or even quite irregular in form, and often presenting a yellowish appearance. In the ceca or blind intestines the disease is accompanied by great enlargement, in consequence of the formation of an internal exudate and a thickening of the cecal walls. One may quite safely infer that the disease is in progress from the semi-liquid consistency and yellowish color of the droppings. Results were obtained indicating that the disease is transmitted from one turkey to another by feeding on the droppings of a diseased bird.

When the work of experimenting with this disease was taken up by the station, it was assumed that the amebae would not be present even in the egg of a diseased turkey. It seemed probable, therefore, if eggs could be hatched and poults reared away from turkeys or on land where none had been kept for a year or more, that the blackhead disease might be avoided.

The first attempt was, therefore, to raise turkeys by means of fowl in the new poultry plant of the station, where there had been no turkeys kept for several years. This attempt resulted in absolute failure to escape the blackhead disease. Whether the disease was carried through the egg, or was transmitted in some other way, remained to be determined.

Following up the investigation it was found that the disease could be escaped for several weeks if the final incubation was artificial, and if the poults were kept on board floors away from ordinary fowl or turkeys. When poults from eggs incubated in the same manner were exposed to the ground of the poultry plant, the disease was acquired in from twelve to twenty days. This proved that the disease was not transmitted through the egg, but in some way from the soil or from forms of animal life therein or thereon.

The investigation also showed with strong evidence was carried and distributed by ordinary fowl, yet nevertheless they rarely die of the blackhead disease, though a few cases apparently identical with the disease in turkeys have been encountered at the station's poultry plant.

The experiments have shown that by removing the turkey eggs three or four days before hatching, wiping them with a cloth moistened with 90 per cent alcohol, finishing the incubation in a machine, keeping the poults for the first few weeks on a disinfected board floor, and placing them in a location remote from ordinary fowls, the losses by blackhead disease prior to reaching maturity may be reduced from a minimum of 80 per cent to from about 15 to 20 per cent.

This shows that turkeys must be

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

kept away from ordinary fowls as much as possible, and in view of the tendency of partially wild turkeys to roam and remain at a considerable distance from the farm buildings, it is possible that the supposed benefit from introducing wild blood is thus partially explained, and that it is not wholly due to greater immunity of the wild birds. It is popularly believed that turkeys cannot be raised successfully in confinement; one reason may be that they are often confined with ordinary fowls, which give them the disease organisms (amebae.) More must be known about the means by which this disease is transmitted before great progress in its practical control can be expected, and the work should be continued so long as new facts bearing upon this point are discoverable. It was only by such persistence that the relation of the mosquito to yellow fever, and the tick to Texas fever in cattle were ascertained, and that practical steps in the elimination of these diseases were made possible.—Alfred G. Lunn, State Polytechnic School.

AROUND THE YARDS.

Exercise is the best and cheapest stimulant for birds.

* * *

The secret in feeding laying hens is not to get them too fat.

* * *

Breed your best birds this year, your profits will be greater.

* * *

The comb is a good indication of health. It should be bright red.

* * *

If you keep your birds scratching in the litter they will not get too fat.

* * *

Fresh meat and bone ground with a bone mill will make hens lay where other feeds fail.

* * *

Chicken Pox.

My chickens and turkeys have begun to die from sore heads. They appear droopy and their heads break out with dry sores all over. Have been feeding them on soaked barley. Will you kindly advise me by return mail what should be done for them. —I. J. W., Lemon Cove.

Your birds have chicken pox. We published a splendid article on this disease in the issue of September 19, but for those who did not keep the article, we give this simple remedy which is good. Treatment: Anoint the afflicted parts with carbolated vaseline, removing the crusts as they soften and yield to gentle rubbing. Cleanse everything and keep all surroundings clean.

• • •

Scratching Shed.

We received a letter asking us why we laid so much stress on a scratching shed, and why birds, especially growing stock and laying hens, needed exercise.

In the first place, we advocate a scratching shed because no well regulated poultry yard should be without one. For young stock or laying hens there is no better or cheaper method to create a healthy appetite than to make your birds scratch or work for at least one meal a day. In poultry, as with yourself, confinement and hearty eating without exercise will cause indigestion. In order to develop bone and muscle, stimulate a healthy circulation, keep the mind and body occupied and prevent the formation of bad habits, such as feather pulling and egg eating, it is necessary to have a scratching shed. We know of nothing that

en writing advertisers, mention Cultivator.

will tone a flock up, prevent the birds from becoming overfat, help in the production of fertile eggs, prevent young birds from having leg weakness, as making them work for what they get in a nice, clean litter of straw in a scratching shed.

* * *

Trap Nests.

Will you please tell me which kind of trap nest is the best and where plans or designs for them can be had?—X.

The best trap nest we know of is one made after the Maine Experimental Station model. This is changed some. They are for sale by Henry Albers Co., and Kloninger Bros. of the city. If I were you I would buy a nest for a model and make what I wanted.

* * *

Egg Production Selection.

What is there in the "Walter-Hogan System of Increasing Egg Production by Selection?" Is it as they advertise?—E. L., Pomona.

The Walter-Hogan system is all right for culling out the non-layers. That is, if you are going to sell part of your flock you can cull out the birds that are not laying, but you can't tell by the system which hens will be laying two weeks or a month from time they are culled. The best and only sure way to cull out the non-layers and those that only lay occasionally, is by the use of the trap nest. In this way you can get rid of your poor birds and at the same time pick out your best layers.

* * *

Pigeons.

Where can I get a start in the pigeon business? I want to secure good stock?—W. R. B.

I think if you will write to some of our advertisers who are advertising pigeons, you will get what you want. Either Kloninger Bros. or W. H. Elliot of this city can furnish you good stock.

ORPINGTON CLUB OF SOUTHERN CALIFORNIA.

The annual meeting of the Orpington Club of Southern California was held at the Breeders' Association Show, Chutes Park, Los Angeles, Jan. 9th, at 3 p. m. G. A. Tate, President, in the chair; four new members were elected, and the election of officers resulted in P. L. Harley, Pres; G. A. Tate, Vice-pres; A. G. Goodacre, Sec. Treas. Executive Committee, N. H. Hayden, J. J. Dean, W. W. Felgate, with president, vice-president and secretary.

The secretary gave a report of the year's work and the publication and distribution of the club catalogue. Total receipts, $81.50; expenditures, $80.05; catalogues, $50.50; special club ribbons, $8.05; printing circular letters, cards, membership blanks, postage, electro of ribbon, stationary, $21.50; leaving a balance of $1.45 in treasury with all bills paid.—A. G. Goodacre, Sectary, Compton.

Many writers when asking advice about sick birds raise the question: "If birds are cured can they safely be used as breeders?" We can answer all such inquiries by stating that it is not advisable to use such birds and that birds which have never been known to be sick or to show a weakness, should be used. Strength and vigor as well as other good qualities can be bred into future flocks only by using the best of birds.

D. F. Cahill of Lemoore, California, says: "The Cultivator is the best dollar's worth in the country."

MUSHROOM GROWING.

LETTERS are received at the Colorado Agricultural College each fall and winter in which inquiries are made about the methods of growing mushrooms. One should know something of the nature and requirements of the plant before growing it. This is particularly true of mushrooms, since there are no other horticultural plants like them. Because of a lack of this knowledge many people fail, and this is not surprising, as they are regarded as the most exacting of plants.

Mushrooms belong to a vast family of plants which have no green coloring matter and produce neither flowers nor seeds. Lacking the green coloring matter, they are unable to manufacture plant food so must live upon that which has been prepared by higher plants. Thus we find them growing upon decaying wood and upon decomposed manure. Many of the kinds which are found growing in the wild are poisonous and none should be eaten without ascertaining for a certainty that they are edible. ,

But one kind is commonly grown artificially; this is known as "aguricus compestris." The seed-like organs, called spores, cannot ordinarily be used in propagation, but in their place the root-like parts are used. This material, called spawn, comes in the shape of bricks which contain the underground portions of the plants in dormant form. Any seedsman can supply spawn.

Mushrooms do not require light in which to grow, consequently beds are frequently made in cellars. Any cellar or cave in which the temperature does not go much below 50 degrees grees will be found to be about right.

A framework should be made for the beds of any convenient length and width, but deep enough to contain about twelve inches of compost after it has been well packed. Fresh horse manure that is nearly free from straw or litter is commonly used to grow mushrooms in, and it should be gathered as rapidly as possible. The manure is placed in a pile so as to induce fermentation, but it must be turned daily to prevent burning.

The heat will soon become intense, but after a few days it will subside; after this stage has passed the manure may be placed in the beds. It should be put in layers and each layer is packed as hard as possible by pounding with a brick or mallet. The temperature of the compost must be watched closely by inserting a thermometer into the bed. When it reaches 90 degrees the spawn should be planted. The bricks of dried spawn are broken into pieces about the size of a walnut and inserted into holes in the manure, about three inches deep and four or five inches apart. The surface should be pressed down firm after planting. In about ten days a coating of good loamy soil is put on the beds two inches thick; this should also be well firmed, then the beds are covered with hay or straw. If everything has been done just right, no further attention will be required until the mushrooms begin to appear. The air of the room must be kept damp, and if the beds become dry, moisture must be supplied. Water should be applied sparingly, however, and the less need there is for its application the better.

If everything goes right, which is doubtful, one may expect a crop four weeks. We must not despair, h ever, if there are no results at the of three months.

The limits of this article will per of only the barest outline of mu room culture, but it will serve show that mushroom growing something of a trade in itself. would strongly advise all who template growing this crop to se the Department of Agricultur Washington, for their bulletins on subject. W. Paddock, Professor Horticulture and Botany, Colorado ricultural College, Fort Collins, C

A GREAT YEAR FOR STRAWBE RIES.

Strawberries in January stri the average citizen of the East wonderful, although the very weal people can have them at any time paying as high as a dollar a bas for fruit grown in the hothouse shipped from the districts around Angeles.

The forwarding of strawberries this season has developed into a v profitable industry. Special arrai ments have been made for hand them by the railroads. One of latest inventions is a refrigera which travels by express to its de nation, and carries thirty-six, fo five or 108 baskets, according to size. The principal points to w the fruit is sent are New York, cago Cleveland, St. Louis and W ington, D. C.

The berries shipped to the ca are, as a rule, for the tables of gressmen, and special lots are sen the White House, of Brandywi which are very hardy, and keep ter than any other varieties. Pri net Los Angeles, on Eastern s ments at present, are from 40 to cents a basket. There have been sons in which the first-mentio sum has been doubled. Losses not very frequent, because of precautions taken.

In this city, an ordinary w earner may enjoy the luscious st berry from January 1 to Decembe at an average price, the year aro of 7 cents a basket. During the plentiful season prices are down cents and even in February March, when the berries ripen sl and are rather scarce, prices neve ceed 20 cents.

This year the crop is heavy, o to the continued warmth of weather. The Tropico and Glen Berry Growers' Association is warding a daily average of 200 cas its local agents, in addition to q titles sent to the North and nea points. The Gardena and Moneta sociations ship as much more, an windale about half the amount. daily consumption of berries in Angeles exclusively this month been about 500 cases. In the s and summer it is 2000 cases.

The grower prospers. From secured, it is learned that a yearl profit of $1500 an acre is exp This has frequently been exceed good years. A Tropico patch of acres in six months brought its $5765 net.

Many fields in this section owned by white people, but care by Japanese and Chinese, who proven themselves particularly for the tiresome routine work of ing down weeds and making pickings and weekly irrigations.

The life of a strawberry plar generally three years. Then pulled up and the ground fert and new plants put in. The va which at present enjoys the gre popularity is the Brandywine, a large and solid. Excelsiors are seconds, and a host of others propagated with more or less su The towns of Tropico, Glendale, neta, Gardena, Strawberry and dale have become famous for berry production. Preparations going on apace in all of these p as well as in new fields for the tation of extra acres.—L. A. Tin

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Answers to Queries.

The number of queries coming to the Cultivator have increased lately, so that we now hardly have the room for all and their answers. This is not said to discourage their coming. Quite the contrary, for they are an indication of the fact that subscribers are looking to the Cultivator for help. That is exactly what we seek to encourage.

But, a word of explanation as to the time required, sometimes, to secure the answer. Many of the questions are of such a nature that they are best referred to the contributors who are actually in the field work. For instance, last week's paper had many answers by J. W. Mills on grapes, pruning, grafting, budding of deciduous trees, and, in fact, a fund of information in his answers alone worth a year's subscription.

Others as to gardening were answered by Mr. Lobingier. Again others by Mrs. Sherman and other contributors. These are of value, because they are answered by people who know.

But to send these from the office to the homes of the contributors who are qualified to answer, takes more time than to answer from the office. Sometimes the one to whom it is sent is absent, so that two or three weeks may elapse before the answer appears. This we are trying to correct as much as possible, and we ask subscribers to be as patient as possible.

Send on the queries but don't ask a mail answer. Let us answer through the paper as mailing answers takes a great amount of time, and is of no value to the 12,000 other subscribers. Where the answer requires immediate attention, enclose a stamp and we will do the best we can, but don't ask it except in case of urgent need like sick stock or other similar cases.

In case veterinary answers are desired by mail, the veterinarian charges a fee of $1.00.

Fresh Figs.

I am thinking of planting a small orchard of fig trees this coming spring and, of course, am desirous of planting the best variety for this locality. I wish to market them fresh as the orchard will be too small to dry and pack. The common black or purple fig does well in this locality.—A Subscriber, Gardena.

We would not engage in fig growing near the coast as you will certainly have trouble with them souring. You cannot catch the early or late market, and growing fresh figs for market has been tried further inland and has not proven very profitable. The Black San Pedro is a very profitable fig around Indio, but they get their figs into market in prime condition from May till midsummer and again late in the fall. They tell us that the demand is limited.—J. W. M.

Warts.

Is there any remedy for warts on colt's upper lips by the nose?—H. Kazarian, Fowler.

Use stick of caustic whittled to point and touch around base of wart. After a few applications they will disappear.

Water Sprouts.

Kindly tell me how to determine the suckers on young Valencia orange trees and the proper time to prune off. Do any but suckers have thorns on? What would be the result of using a wax on bruised or squirrel eaten trees composed of half rosin and half bees wax. Does this not make to hard a wax?—A New Subscriber.

If you mean by suckers, those branches that come from below the bud, you do not need to discriminate, but trim off all such growth up to the main branches. If you refer to the rank growth that comes out from the inside of the trees, we will say that in training a young orange tree, it is advisable to cut out the rankest growth and leave the growth of medium vigor. This strengthens the main branches and gives the trees a good form. When they come into bearing large crops, they will be able to hold them up without propping, and the fruit will not be swung around by the wind and become bruised. Heavy sprouts that come up through the body of the tree should be removed, unless they fill in a gap. Thorns may come on any branch, but are most common and are larger on rank growing branches.

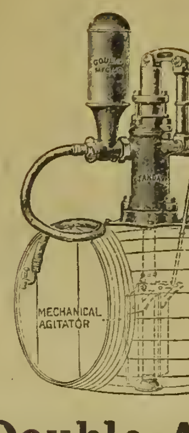
Surfaces of the trees from which the bark has been scarred or barked in any way are much benefited by painting with wax. The right proportion is four parts rosin, two parts beeswax and one part tallow. Boil together till they are thoroughly mixed and paint it on the wounds while hot, using a brush. It should not be boiling hot, but thin enough to flow well.—J. W. M.

Walnuts, Almonds, Loquats, Etc.

When should I sulphur my grape vines? I have two loquats both set out about three years ago. One is thrice the size of the other, but the small one is full of fruit and the large one has not shown a blossom. Is there any reason for its non-production? I have been coaxing an English walnut along for four years, and now your paper says there are male and female trees. What shall I do to have English walnuts from my one tree? My almond tree has borne two years, but only a dozen nuts or so each year. Must it also have a mate to set its blossoms? Can you give me information about planting cow peas in a lemon orchard, when it should be done and when ploughed under?—Inquiring Subscriber.

You should sulphur your grape vines as soon as the grapes are set and that is when they have passed the bloom and the little berries have begun to enlarge. Sulphur again in about two weeks; this should be sufficient, but your locality may require another application. The sulphur will not take effect till the temperature approaches 80 degrees, and if you have a great deal of damp weather late in the season, another application of sulphur soon after the second may be of help to you.

It is a mistake to think that walnuts have male and female trees. The catkins that come out before the leaves appear, furnish the pollen that fertilizes the little nuts that appear



Double-Acting Sprayer

With 3-inch brass-lined cylinder, brass-encased outside-packed plunger and brass valves. Large air chamber and long lever. Powerful enough for two leads of hose and four nozzles. Can be placed on end or side of barrel.

Complete outfit, including Pump with suction pipe and strainer, one 25-ft. lead of 1-2 in high pressure spray hose, 6-ft. iron pipe extension and one Seneca spray nozzle (no barrel or agitator) packed ready for shipment for $12.75.

In ordering state whether you want sprayer for end or side of barrel.

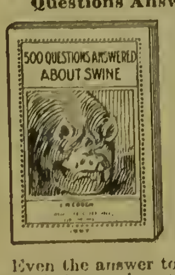
500 HOG QUESTIONS ANSWERED
A Copy of the Latest Authoritative Veterinary Swine Book. "Five Hundred Questions Answered ABOUT SWINE," Is Almost Certain Hog Insurance.



This latest Manual for Hog Breeders and Feeders, just published, actually contains answers to 526 live questions, which were really asked by Hog Breeders within the past five years.
The questions relate to Breeding, Mating, the Choice of Breeds' Feeding, Fattening, Management, Diseases, etc., of Swine. The questions and answers are carefully arranged and the complete index enables one to find at a glance the answer to the question he has in mind.
The Veterinary Department is so complete that a copy of this book in the hands of a breeder will pay for itself many times over in saving one pig.
INDISPENSABLE TO EVERY HOG RAISER.
The answers to questions on Feeding contain information which will put enough extra pounds on one pig to pay for a dozen books. Multiply this by the number of hogs you own and figure out what the book is worth to you.
Even the answer to just one of the 526 questions would cost you nearly 25 cents in time, letter writing, and postage stamps, besides the loss you might stand while waiting for the answer.
The information and answers are wholly dependable and come from the practical experience of the largest Swine Breeders and Feeders in the West and the most authoritative veterinarians.
THIS BOOK WILL BE SENT FREE ON REQUEST
To readers of the CULTIVATOR who send at the same time their subscription for the coming year. Good only to those paying in advance. See particulars on Editorial Page under "Shop Talk."

later on the tips of the young growth.

Your big loquat tree is a loafer and needs grafting to something that will work. If you like the quality of the fruit on the bearing tree, graft from that. It might be satisfactory to try some grafts of Taft's Advance loquat. Write to C. P. Taft at Tustin.

Your almond tree may be one of the kind that does not bear well alone, but they sometimes produce a heavy crop. Almonds bear better when two or more varieties are planted in lose proximity, but for the home orchard two trees, Languedock and Ne Plus Ultra are good varieties.

Peas should be planted in the orchard as early as September so as to get a good start before the cold weather comes on. Vetch has proven better than peas as it grows well during the cold weather and does not dry out so fast in the spring. There are two methods quite widely practiced in planting green crops. One is to irrigate thoroughly and drill in the seed as soon after as the land is fit to work and the other is to drill in the seed and furrow out and irrigate afterward. We prefer the first method as the soil is cultivated soon after irrigation and does not have to be irrigated so soon again.—J. W. M.

Peaches, Walnuts and Olives.

Will you kindly answer the following queries through your valuable paper: What do you consider the best cling peaches to plant in Sacramento valley, considering sureness of crop, heaviness of yield and quality? What is the comparative value of seedling walnut (English) and the grafted, and would you advise one in limited circumstances to pay the great difference to get the grafted stock? Will the soft shelled varieties sunburn in the interior valleys? What is the best variety of olives for pickling, considering heavy and sure yield, size and easiness to cure?—J. Overholtzer, Princeton, Colusa Co.

The best peach for the Sacramento valley, everything considered, is the Phillips' cling. It is so, because it is a good bearer, fine quality, has a small pit and is an ideal peach for the canner.

There is no comparison between a seedling and a grafted walnut orchard when the scions for the grafted trees are selected from trees of high grade. There are seedling trees that average 200 pounds of nuts per tree a year, while trees grown from the same set of nuts and are next to the prolific tree in the orchard, may not average 20 pounds of nuts per year.

If you cannot afford to buy grafted trees, get some California black waluts and plant them in a nursery, don't plant them in orchard form, because you will have all degrees of vigor. Select the best trees from the nursery and plant them where you want them to grow. In the meantime go to some full bearing walnut grove, select out the tree that produces the best nuts in abundance and engage scions from the owner. Graft these into the tops of your seedlings about six feet from the ground. Do this early in February, grafting into the young branches just as you would an apple or pear tree. You can do this grafting the second year after transplanting into orchard form.

The soft shell varieties, as far as we know, will sunburn, and those which are so situated on the tree that the shell does not burn, will have dark meat; that is, the skin that covers the meat will be dark, thou the eating quality will be uni paired.

The best variety of olive for pic ling is the large Mission. I do n know exactly where you can get tl strain, unless it is of some of the nu serymen. Mrs. M. E. Sherman h this variety or strain of the Missi olive, we have been told.

Santa Caterina is also a fine oli but makes a lighter colored produ than the Mission. It is much soft than Mission, hence harder handle, and as the dark color pickle is in most active demand, t Mission is the best seller. It has t advantage of being well establish in the trade.—J. W. M.

Paper Pots.

I saw in the Cultivator of Jan. 2 a suggestion in Vegetable Gard Department to put cucumbers frames, to be removed later to fie Do you know of any practical me od by which they can be handled as not to disturb the roots and dw the vines?—J. C. H., Ontario.

Paper pots are now sold by nea all florists, they are the cheap and best things I know of with wh to handle such plants.

Procure 2½ or 3 inch sizes and them closely together in a flat, a sift finely prepared soil over th until they are full and all the spa between the pots also filled. T plant about three seeds in each The flats can be taken to the f when the plants are ready to set and pot and all planted. The si of the pot should be cut or torn o but with care so as to disturb roots as little as pssible. The ob is to allow the roots to strike into the soil as quickly as possi This same method can be used w melons and peppers, or in fact, w all tender plants that it is desir to get forwarded early.—Q. A. L.

July Blossoms.

I have a twelve-acre orange gr have only owned it one year would like a little information. majority of my trees have from half dozen to five dozen green anges on when the main crop is colored; the size of the green are from the size of ordinary oranges to the size of hickory I also see that is the case in rounding groves. Can you tell the cause of same, also the thing to do with them, whethe let them ripen for sale or pick t off?—W. B. Cavers, Ontario.

Your green fruit is from bloo of season, chiefly from July bl There is always more or less of it it may be from a variety of ca It always happens to a certain tent. When the summer gr comes out a few blossoms will pear, and as the climatic condi are ideal for setting fruit at time, we nearly always get coarse fruit.

Do not pick the fruit, but hang on till you see how the market is. If Standards bring prices, much of this fruit will as Standards, otherwise, it is w cut it off and leave it in the orcha J. W. M.

Grape Arbor.

Can you tell me what to do wi arbor which is certainly neith thing of beauty or a joy foreve is probably eight or ten years o comprised of Flame Tokay, Se Sultanas and a large white kl grapes. Has been so poorly tr that it is very gnarled; vines only six feet apart and bra very low. Didn't get a bunc good grapes off from them last Would they do any better to them back to about five feet eep in bush form? The soil they re planted in is a heavy, black soil. Irs. T. W. Murieta.

The best thing for you to do is to rune the Tokay vines to about three uds on the new growth and the ultanas to canes of about six or even on some canes, and at the base f these cut a cane back to two buds. ach year remove the long cane vith all of its new growth and start gain with the new shoots that come rom short pruned canes. Spray our vines with a solution of one ound of bluestone to ten gallons of vater after pruning. This may be one with a small bucket pump. fter the grapes have dropped their loom, scatter sulphur under and ll through the vines and about two eeks later repeat the sulphuring. t may be well to work in some table manure around the roots of he vines. This will help them to reover from the effects of any neglect; nd in another year you should have ome good fruit.—J. W. M.

liens Holding Property.

Kindly say whether there is a tate law in California prohibiting liens from holding land. If so, where an I get a copy of the laws. Am a ritish subject at present, but have eclared my intention to become a . S. citizen.—Reader, San Diego.

Sec. 17, Article I, of the California onstitution, provides that: "Foreigners who are or who may hereafter beome bonafide residents of this State hall enjoy the same rights, in respect the possesion, enjoyment and ineritance of property as native born itizens."

And Section 671 of the Code of Civil rocedure provides that: "Any peron, whether citizen or alien, may ake, hold and dispose of property, eal or personal, within this State.

rivate Property.

Can a company take my private itch, enlarge it, and run it through y lands, onto theirs, against my ill? Also, can an irrigation ditch e forced across your lands?—J. ones, Bakersfield.

Private property cannot be taken r public use without a fair and just ompensation to the owners. Nor can stranger, whether a corporation or ndividual, take it without compenating the owner.

arget.

I lately bought an old cow, nearly ry, due to calve in two or three onths. From one front quarter is cheesy or curdled yellow matter, and oesn't seem to diminish, although I m milking it out only at intervals f two days. Seems to be some fever the quarter. Withdrawing milk is ainful to the cow. Milk in other ront teat is of the same nature, ut only small quantity. What is the est treatment in drying it up?—Subcriber.

Dry her off by rubbing the udder wice a day with spirits of camphor. ive the cow a physic of a pound of psom salts. Keep her on dry hay ntil she is dry. The trouble has been hat she has not been milked dry evry time. The way to dry a cow is to eave a little milk, but watch that it s only a little, and use the camphor fter each milking to help absorb that ittle left in the udder.—M. E. S.

eed for Jersey.

What is considered a good and yet rofitable ration for Jersey cows?— ., Upland.

Give her alfalfa hay, fifteen to wenty pounds a day. Make a mixture f one part bran, two parts rolled arley, and feed a quart twice a day. f this pays, increase the grain a little. If you could find some straw the cow should have all she will eat up clean of it every day.—M. E. S.

Fleas on Horses.

Can you give a remedy for fleas on horses' front and hind legs? They do not seem to have any on their bodies. —L. K., Falbrook.

I presume these are the fleas that stick into the animals. Simply grease them well. Kitchen grease, vaseline, lard or any form of grease will destroy them completely.—M. E. S.

Swelling on Jaw.

I have a very fine Jersey heifer that will be fresh soon. About three months ago a swelling came on her jaw. Supposed it was from fox tail. Had it lanced but it did no good. It is as large as it was before lancing, although it is not on the bone.—J. O. W., Santa Barbara.

I should simply paint this with iodine for several days.—M. E. S.

Moss on Trees.

Will you kindly inform me as to what would be the best spray for moss and scales on apricot trees?—Subscriber.

For the moss the sulphur, lime and salt wash will be as good as anything, and, of course, it is good for scale.

Gypsum.

I find that in the San Joaquin valley gypsum is used as fertilizer with fine result. How would this do for an uphill land in Sonoma county? For instance, on a field of oats for hay. If good, when and how should it be applied?—F. J. K., Healdsburg.

A good authority makes the claim that gypsum is of no direct value. That is, it carries no fertility to the soil, but makes available fertility now in soil, hence impoverishes soil in time. Alkali soils, if black alkali, are benefited. Heavy clay soils are also more workable and in better mechanical condition. We would consider the best use to be scattered occasionally in stable to absorb nitrogen, which might otherwise escape. It is a wonderful absorbent. If used direct in field scatter broadcast about a half ton per acre.

Gypsum for Alfalfa.

How much gypsum is necessary to spread over an acre of alfalfa to benefit it? Also, how much is necessary per acre to benefit black adobe soil to render it friable?—Subscriber.

About 1000 pounds. Would advise trial plots, some treated, some not, and the Cultivator will appreciate a report of results.

Ensilage.

My cows do not like ensilage and milk fell off when I began feeding. Had to give bran to induce them to eat. Do not eat hay as well as formerly. Ensilage is good and sweet.—C. O., Burbank.

Cows are creatures of habit and when fed for long periods, or all their lives, on one form of food, it requires a little time to take kindly to a change of food. Mix a handful of the ensilage with their bran, increasing the quantity day by day, until they learn to like it. When you train cows to a varied diet it is possible to have them willing to accept with aivdity anything added to their ration.—M. E. S.

Seed Potatoes.

Can you please tell me where to get some good early Rose seed potatoes? A reader, Dinuba.

The seed men advertising in the Cultivator say they can supply with fine seed potatoes.

Sweet Potatoes.

Sweet potato queries will be answered by a couple of communications next week.

PILES CURED IN 6 TO 14 DAYS

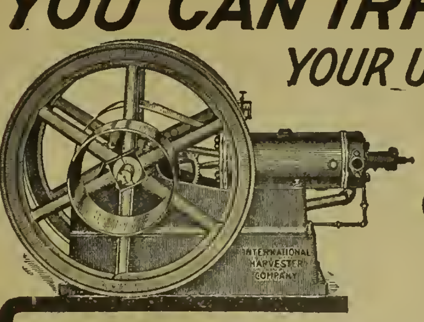
YOU CAN IRRIGATE
YOUR UP-LANDS WITH AN
I. H. C.
GASOLINE
ENGINE



NO need to go up stream and construct miles and miles of ditch to get the water high enough.

Place one of the powerful I. H. C. gasoline engines on the stream where it is nearest your land. There are large engines for irrigating on a big scale and smaller engines for small farms.

These engines are the best means for raising and utilizing the underflow; also for raising water from lakes, ponds, and wells, and also running streams.

They will raise all the water you need and deliver it just where you want it—in the ditch or in laterals.

The first cost of one of these I. H. C. gasoline engines is, in almost every case, less than the building of a long ditch to enable the water to flow naturally to the land.

And the cost of running is always less than the cost of keeping the ditch clean of drifting sand, silt, weeds and fast growing bushes.

In many cases, an I. H. C. engine enables you to reach the knolls and other high places which you cannot reach at all by ditch without expensive flumes that are "tumbledown" and must be repaired every spring.

The engines are made both vertical and horizontal and in many sizes from 1 to 20-horse power. They are easily controlled and run dependably. The irrigator does not need to give them constant attention.

Only an occasional return to them, to replenish the fuel and water supply, is all that is necessary. One man can handle the head of water in the field and at the same time attend to the engine.

International local agents will furnish catalogs and give particulars on all sizes of irrigating engines. Or write the nearest branch office.

WILLIE'S WEEK.

The year had gloomily begun
For Willie Weeks, a poor man's
Sun.

He was beset by bill and dun,
And he had very little
Mon.

"This cash," said he, "won't pay dues,
I've nothing here but ones and
Tues."

A bright thought struck him, and he said,
"The rich Miss Goldrocks I will
Wed."

But when he paid his court to her,
She lisped, but firmly said, "No,
Thur."

"Alas!" said he, then I must die"
His soul went where they say souls
Fri.

They found his gloves and coat and hat,
And the coroner upon them
Sat.

THE FARMER'S HOME.

WEBSTER defines home as a "dwelling-place," but it admits of a broader meaning. There are brilliant and elegant homes. Some are wise, thrifty and careful, and others are warm and genial, by whose glowing hearths any one, at any time, may find enough and to spare. There are bright homes and gloomy homes. There are homes tnat hurry and bustle through years of incessant labor, until one another of the inmates fall, like the falling leaves, and the home turns to dust. We do not say the dairymaid's home compares with this last view. Science has done much to remove the drudgery in our homes, introducing ease and comfort. An ideal home must first have a government, but love must be the dictator. All should unite to make a home happy. Wt should have light in our happy. We should have light in our ent light. It matters not whether home is clothed in blue and purple, if it is only brimful of love, smiles and gladness.

Our boards should be spread with everything good and enjoyable. We should have birds, flowers, pets, everything suggestive of sociability. Flowers are as indispensable to the perfection of a home as to the perfection of a plant. Do not give them all the sunniest windows and pleasantest corners, crowding out the children. If you cannot have a large conservatory, have a small one. Give your children pets, so that by the care and attention bestowed upon them they may learn the habits of animals.

Of the ornamentation about a house, although a broad lake lends a charm to the scenery, it cannot compare with the babbling brook. As the little streamlet goes tumbling over the rocks and along the shallow, pebbly bed, it may be a marvelous teacher to the children, giving them lessons of enterprise and perseverance.

In our homes we must have industry and sympathy. In choosing amusements for the children, the latter element must be brought in. To fully understand the little ones, you must sympathize with them. When a child asks questions don't meet it with, "Oh, don't bother me!" Tell it all it wants to know. Never let your angry passions rise, no matter how much you may be tried. For full an intelligent happiness in the home circle, a library of the best works i necessary. Do not introduce th milk-and-water fiction of the presen day, but books of charcater. Ou homes should have their Sabbath and their family altars. Aroun these observances cling many of ou most sacred memories.—William H Yeomans.

THE GRIP EPIDEMIC.

Physicians are reporting an epe demic of grip throughout the citie of California. It is a contagious disease which often leads to serious results. It begins with a cold, usuall followed by a chill which develop fever and frequently pueumonia.

As soon as the disease reaches severe stage the patient should g to bed and stay there several days In every case warmth is essential Keep well covered, do not allow draught of air to reach the patient but sleep where plenty of fresh ai circulates in the room. Grip hate fresh air.

Physicians prescribe hot lemonad and whisky and ginger to warm th body, taken at bed time with plent of blankets to keep from quick coolin Stay in bed a week if necessary, un til the fever is broken. Take n chances after the fever is broken for an ounce of prevention is wort several pounds of cure.

If a cough develops, at the clos of the fever, a compound of equa parts of glycerine, whiskey and a littl bi-carbonate of soda is recommended Take every hour. The disease is no one to be trifled with. It is dangerous even in this climate, and must b overcome at its inception or it wil linger and result in a permanen affliction of some character. In th cities of Chicago, Denver and Kansa City, it is sweeping like a cyclon and hundreds are dying while thou sands are ill. It is best, however, t consult a physician and take medicin strong enough to combat the disease otherwise the patient may be sick fo a long time. The cities and towns ar most affected, but the country is als afflicted, as the malady is contagiou and is carried from one section t another.

DOCTOR APPLE.

An apple each day keeps the doct
away;
Another at night starves him outrigh
An apple each meal, and one for slee
Will kill him and shroud him and bur
him deep.

This little jingle should have place on the door of every medicin closet, and indeed if the apple we more generally regarded from medicinal viewpoint the contents the medicine closets could be ve largely dispensed with.

A prominent physician once s that "if one-half the meat, on fourth the bread and all the cand given to children could be made give place to fruit, of which appl formed a large proportion, the dea rate would be greatly reduced, the bodies better formed, and all wou be healthier and have far great brain activity."

Good, well ripened apples eaten reasonable quantities not only w never be injurious to a child grown person, but if taken as a foo are the most acceptable, satisfyi and healthful one that can chosen; and this is equally tr hether they be eaten fresh or after reserving, canning or drying.

As the apple contains more phoshoric acid in easily digested form han any other fruit, it is of high alue as a brain food. It is also a horough disinfectant of the mouth, hat important doorway to the stomch, and if eaten regularly does nuch to prevent throat diseases.

There is no better remedy for inomnia than a ripe, juicy apple aten just before retiring. Its wholeome acid excites the action of the iver and promotes sound and refreshng sleep.

For the same reason an apple aten before breakfast every mornng will prove the best of complexion eautifiers. No devotee of apples ver suffers from jaundice or liver pots, and dyspeptics are almost inariably ordered apples for their holesome action upon the digestive rgans.

The tickling sensation of the roat causing one to cough at night ay be greatly relieved by placing a asted apple by the bedside and king a spoonful of the pulp when noyed by a desire to cough.

As the apple can be had in fresh d perfect condition during a great portion of the year than any other the fruits, the appetizing ways of eparing it have grown to be legion, that one need never tire of it rough lack of variation. And as e heat applied in cooking breaks wn the cells, and more thoroughly ends the acids and sugar of the uit therewith, its wholesomeness d digestibility are increased by oking.

Wise in her day is the housewife d mother who numbers "Doctor pple" as a regular and honored ember of her household.—Advocate.

TO MAKE YOUR HANDS BEAUTIFUL,

Care of the Nails.

You will need:

A pair of sharp curved nail scissors.

A good file.

A cuticle knife.

An orange wood stick.

A plain, well-padded chamois polner—and, by the way, don't buy em in a set or case; pick each one t for its particular virtue.

You need, also—

A cake of good soap.

A bottle of peroxide.

A bit of pumice stone.

A box of paste and one of powder.

We will assume that you have not en as good care of your nails as u should have done.

If you can't go to a first-class manire and get stated right, this is the y to do it yourself:

Soak your fingers in water warmer n tepid. Do not put soap in the ter unless you want your hands to k as if you had been doing a wash. Trim the nails closely at the es, curving them to a little more gth in the middle, but dont have m look like claws. Bevel them with file. Put the orange stick into the ry soap and cleanse the nails in un and about the edges, pushing back cuticle at the base until the halfon shows. If the cuticle is ragged, it even with the scissors. If any eres to the nail remove it with cuticle knife.

You will never have those disaeable hang nails if you keep the icle free and well pushed back, and will not have to use the scissors the future, which is bad for the n.

ip the orange stick into the peroxide and remove any stains that the soap fails to reach. With the finger put a bit of paste on each nail. Dip the polisher in the lusterite and with it rub the nails vigorously.

Remove any powder from under or about the edge of the nails, wash the hands and dry thoroughly.

After a thorough manicure, which should be done weekly, all you need to do each day is to keep the nails clean and the skin pushed back at the base of them, so tne half-moon always shows.

HOMELY HINTS.

A few drops of essence of sassafras will keep flies away.

Unused silver will keep bright if laid away in a box of flour.

Cloves or salt sprinkled on a pantry shelf will rid it of ants.

You can make a faded dress perfectly white by washing it in boiling water.

Salt dissolved in alcohol will often remove grease from clothing.

Linen blinds can be cleaned by being laid flat and rubbed with powdered bath bricks.

A spoonful of mustard in a gallon of water will kill insects in the earth This is good for potted plants.

Two potatoes grated in a basin of water will give better results than soap in washing delicate flannels and woolen goods, ribbons.

You can remove the odor of fresh paint from a room by leaving there a pail of water into which several onions have been sliced.

A crack in the stove may be patched by filling with wood ashes and salt moistened just enough to work well. Smooth down neatly and cover with blacking.

SHE IS WISE.

Who keeps in mind that a little credit is a dangerous thing.

Who is able to mend both her husband's clothes and his ways.

Who has learned the paradox that to have joy one must give it.

Who can tell the difference between her first child and a genius.

Who most admires those eyes which belong to a man who understands her.

Who acknowledges the allowance made by her husband by making allowances for him.

Who appreciates that the largest room in any house is that left for self improvement.

Who realizes that two husbands of 25 years each are not necessarily as good as one of 50.

Who can distinguish between the laugh of amusement and the one meant to show off a dimple.

Who gets off a trolley car the right way—though she runs the risk of being arrested as a man in disguise.

JEFFERSON'S TEN RULES.

Never put off until tomorrow what you can do today.

Never trouble another for what you can do yourself.

Never spend your money before you have made it.

Never buy what you don't want because it is cheap.

Pride costs more than hunger, thirst and cold.

We seldom repent of having eaten too little.

Nothing is troublesome that we do willingly.

How much pain the evils that have never happened have cost us.

Take things always by the smooth handle.

When angry, count ten before you speak; when very angry, count a nundred.

ANOTHER LAND OPENING.

The Kern Island lands just a fe miles south of the city of Bakersfiel have at last been thrown open, and a the remarkable old time land prices o only $25 an acre. These lands wer held for many years by the great la and cattle companies of Kern count and have not been advanced in pric like in some sections of the big Sa Joaquin valley. The land is in the A tesian belt; has all been under cult vation at one time, and those wi take it may develop their own flo ing artesian wells or buy water righ from the Kern river canals at only $ an acre for a perpetual right. Pr fessor Fowler, formerly conductor farmers' institutes for the State Ur versity, has experted the lands a pronounces them equal to the be sandy loam soil in the State. T opening of these lands is in charge the California Home Extension Ass ciation of 102, Chamber of Commer Building, Los Angeles.

MODERN PRACTICE IN "AMEI ICAN" CENTRIFUGAL PUMP CONSTRUCTION BULLETIN NO. 104.

is just issued by the American W Works, Aurora, Ill. It illustrates the styles of centrifugal pumps ma for such purposes as farm irrigati drainage, brewery pumps, fire pu and many other similar purpo This well known firm also furnis complete literature in regard to chinery for well drilling, oil, gas Our readers will do this publicatio favor by stating where they read notice, in writing this firm.

A TRAIN LOAD.

Tim Carroll of Anaheim is one of oldest nurserymen of California has the biggest stock of palms to found on this big, round globe. they are beauties and they are ones. Canariensis and Robustas his heaviest lines, but bless you, if want anything in hardy palms write Tim Carroll at Anaheim.

Anything from a two-bit plant t train load can be supplied at his series.

The Curtis Silk Farms will move their silk worm Cocoonery t the temporary quarters corner B Vista St. and Solano Ave., Los geles, to their farm in the San Ga valley. Further cultures will be on the Farm where they have a th mulberry grove to furnish fodder the ravenous army of silk spinne

San Francisco Markets

SAN FRANCISCO, Jan. 28, 1908.

Butter.

The week has seen no change in quotations on fresh extras, but firsts and storage have both declined. The general condition at present is fairly firm, but further decline predicted as weather warms up.

The current prices on dairy products in San Francisco are always from 2 to 3 cents higher than the rates given in the daily official list of the Wholesale Dairy Produce Exchange. The retail dealers in this city invariably pay an additional 2 cents per pound on butter and per dozen of eggs, and occasionally it is 3 cents. On cheese the increase is 1 cent per pound. By making these additions to the Dairy Exchange prices the producer in the country can always determine the actual prices ruling in this city. The quotations as prepared by the San Francisco Wholesale Dairy Exchange yesterday were as follows:

California extras per lb	34½
California firsts	25
California seconds	22
Eastern extras	23
Storage Cal ex	23

Cheese.

California young American fy	15

Hay.

Receipts of hay for the past week amounted to 2350 ton, considerably less than last week's arrivals and, in fact, less than has been received for a considerable time past. Cars are very plentiful throughout the State and, of couse, there is a large quantity of hay available for this market, and the recent decrease in shipments can only be accounted for by the fact that holders of hay are unwilling to sell their stocks at the present range of prices. Although receipts have been fairly, evenly distributed during the week, yet it was only during the last couple of days that we could see any better feelings at all on the market, as there was so much surplus stock on hand here both for sale and in consumer's barns. The better feeling during the last few days is not very marked, and conditions will be governed by the amount of hay which holders are willing to send to this market.

Consumption of hay in the interior continues very heavy and many of the holders of hay who anticipated sending their stocks to San Francisco are disposing of it elsewhere to better advantage.

Citrus Market

LOS ANGELES, Jan. 29, 1908.

The orange market has been rather streaked for the past week. Some of the Middle West sections, likewise some of the farther Eastern markets are depressed, partly perhaps by the weather prevailing there, also by liberal shipments. It is hoped the slower shipments forced by the storms will equalize conditions and give better prices.

The storm came with nearly all packing houses filled with fruit and this surplus has kept houses busy until this time. The storm has now passed, apparently, and fruit delivery will soon be resumed, so there will be but slight delay.

Lemons still command a fair price, though many foreigns are still arriving. Local shipments are going forward with regularity.

Total shipments of citrus fruits to date since Nov. 1, 5356 cars, of which 944 were lemons. Same date last season 4075 cars, of which 555 were lemons.

NEW YORK, Jan. 17.—Sixteen cars navels, one car Arizona navels, and one car lemons sold. There is a little better feeling on navels, and prices are generally higher on best fruit. Lemons are also doing better and prices are higher. Weather is clear and favorable.

FRUIT GROWER AND PARCELS POST.

Continued From First Page.

shipped in the cars, and thence delivered at the house of the addressee in such quantities as suit his convenience. Similarly, goods can be shipped to him from any part of the kingdom and delivered at his gate. It does not matter one whit whether it is cream, butter, eggs, fruit, fish or fowls, anything goes, goes on time, and gets there on time. One firm shipped 70,000 parcels in two days.

Just how useful such an institution would be to us each, one can readily picture for himself. The endless waste of time, and the constant annoyance daily experienced for lack of such service. we all too keenly realize. The comfort of such an institution, the saving of cash and energy, of time and temper, also appeals to us all. Whether we are to enjoy this inestimable boon to all classes depends on ourselves. We are too prone to relegate our responsibilities on that impersonal thing we call our government. We forget that WE are the government, and that unless THE WE people issue OUR mandate, no reforms are possible. All reforms come from outside pressure, not from spontaneous internal action. It is for you to instruct your congressman in such forcible and unmistakable terms as shall leave him no option but to vote for an up-to-date parcels post or make way for one who will.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow Street, Los Angeles.

The Brust Portable Automatic Derrick

is the greatest labor saver on earth—if you doubt it, buy one and convince yourself. Two men and a boy will unload and stack a two ton load of hay in less than ten minutes and will load out of a stack on to a wagon in the same length of ime. Makes loading baled-hay an easy and quick job. No guy-ropes required and always ready for use.

California Cultivator

os Angeles February 6, 1908 San Francisco

Our Citrus Special Next Week

Next week's Cultivator will contain a fund of information on Citrus Culture which will be of value to many readers.

J. W. Mills will touch upon Citrus Culture in California, location, bud variation, types of trees, planting trees, etc.

S. A. Pease will give details of fumigation. How to make the tent sheets, prepare them so as to hold the gas, size of dose, time of exposure, etc.

J. H. Reed will discuss as to whether a fruit grower on thousand-dollar land can afford to waste any of it by planting large growing trees along the streets.

B. J. Jones will write of lemon pruning, discussing both old and new systems.

Citrus conditions at Oroville will be described by a local writer.

We hope A. E. Miot will write of conditions in Tulare county.

John Isaac will talk of Northern citrus conditions in general.

There will also be a short history of the greatest co-operative fruit marketing organization in the world.

Also other features not here mentioned.

It will be a good number regarding a great industry.

Everything for Spraying

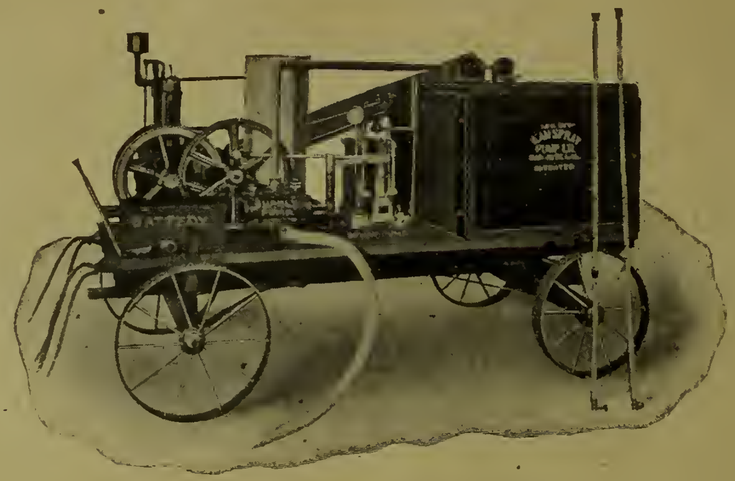
Let us quote you on everything you need including bluestone, arsenate of lead and all spraying materials. We have the best goods for the purpose, lowest prices and make prompt shipments.

Spray Dollars

Many growers who sprayed this year for the first time secured $200 more per acre for peaches than ever before.

Don't think your orchard is too far gone. We will help you make it pay and your success will bring us other orders.

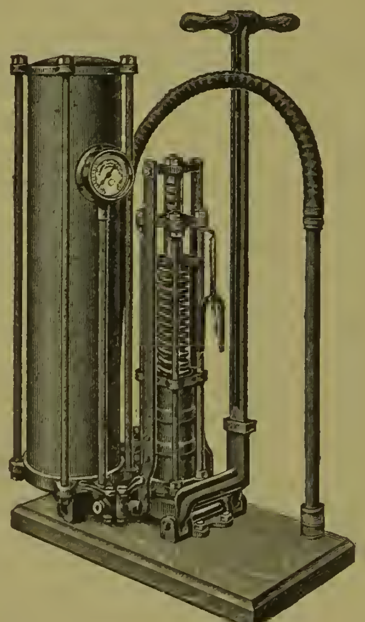
Fitted with aluminum spray rods and other new good improvements.



On Your Trees

Bean Power Sprayers are known the world over. Simple, complete and ready for use.

If you have an engine let us built it into a complete machine. We can supply anything you want. A complete outfit will save you money and trouble. Built for high pressure and with large capacity.



BEAN MAGIC PUMPS

(TWO SIZES)

The Two Easiest Running Spray Pumps Made

These pumps were awarded First Prize by the Government Experts who were judges at the International Exhibition at Christchurch, New Zealand, with this commendation: "We find these Magic Pumps operate with more than one-third less labor. This is due to the improved spring attachment. They also have other improvements."

No wonder they are big sellers! Think of what this means—Saving of one-third of all your labor cost. Putting the material on with one-third higher pressure. The pump simplicity itself; no valve or other trouble, but thorough spraying at the least possible expense.

The saving in labor will pay for the pump and your spraying will be so much better done that any other pump would be expensive if you got it for nothing.

Send for Catalogue No. 20 for full description and prices. Freight paid to your station. If you want to get results investigate these pumps at once.

SPRAYING AND WHITEWASHING

Have you a "family orchard?" Have you whitewashing to do?

This is a splendid outfit for small jobs—no matter what materials you use.

This No. 60 is a very simple pump, easily mounted on a barrel, and it won't wear out—except two of its inexpensive parts—while you are here to tell about it.

CATALOGUE NO. 20 DESCRIBES FULLY

Price is low, delivered at your railroad station. Write us.

BEAN'S LITTLE GIANT

The Best Barrel Pump

Everything you could want in this style of pump. Fastens in any barrel or tank.

Agitates perfectly. Has large air chamber. Also ball valves and never-wear-out cylinder.

You can't afford to HIRE YOUR SPRAYING DONE when you can get so good a pump for so little money.

Write us for prices on this pump delivered at your depot.

Also all spraying materials.

Commercial Value of Ornamental Trees

California's Sequoias Bring Millions of Money to This State. Eucalyptus Have Proven to be Wonderfully Adapted to Our Conditions.

A Paper Read Before the State Fruit Growers' Convention

Prepared by C. B. MESSENGER of the Cultivator Staff

OMETIME since when one of the largest tourist hotels near Los Angeles was being constructed, it became desirable to make tain changes in the plans. After the archit's changes had been accepted and contract , it was found on making measurements that e of the many fine large live oaks must be saciced. This was contrary to the wish of the ner and he demanded that still other changes plans be made so as to save the old oak. is the contractor refused to do as it would cost large sum. Instructions were finally given, wever, that the changes should be made so as save the tree, providing the additional cost to e owner should not exceed $5000.

Five thousand dollars may then be taken as at one man's estimation of the value of that k in that particular location.

other at $500.

Again, upon the occasion of widening a street Los Angeles it became necessary to destroy a autiful "Poke Root"—Phytolacca. The owner fused to have it destroyed, unless he be comnsated for the loss of a tree which to him was great value. The matter was referred to arrators and after consideration of the facts he is allowed the sum of $500 for his tree.

Other instances might be given where a price is been placed upon a tree or a number of em, or where large sums have been spent in curing and moving to a certain location trees hich appealed to the fancy of the owner. But e above two instances may be sufficient to use us to ask, can any such value be placed on trees?

Let us grant that the first instance of the $5000 aluation is extreme, and while it may obtain gain. it is highly improbable. But the second stance surely is not, for after careful consideraon fair men made such award as compensation r its destruction.

But aside from the financial value—the calcuted, hard and fast value of so many pounds nd ounces for so many dollars and cents—let us ok at another value, still greater. Let us go ack to the old days when the "wood lot" was mmon, when a whole community gathered on e bank of the river under the great sycamores, alnuts, maples and beeches and enjoyed a day f unadulterated happiness. Such a grove rought many a stray dollar to a community.

oin as Well as Sentiment.

It is not possible to compute the amount of old poured into Switzerland's lap because of er wonderful mountains. Neither is it possile to compute the gold poured into California ecause of the fame of her giant Sequoias. The mber man looks, with measuring stick in and, and begrudges the waste of such a vast uantity of lumber as one of those trees contain. ut should the greed of immediate possession vercome the more far-sighted and enlightened olicy of protecting our great heritage? It will e a sorry day, indeed, for California, and result n the loss of millions—millions, not of sentiment nor in simple pride that one can stand and oast that "WE have the largest trees on earth" –but millions of hard dollars.

But why reduce the consideration of those oble friends of ours to such a sordid basis? Is ot our love for the Sequoia of the Sierras, or he oak of the hills, or the Sycamore of the valeys and canyons sufficient to protect them?

Too often it is not. Within a stone's throw of my home I can look down on hundreds of fine sycamores lining either side of Arroyo Seco; yet often I can hear the axe claiming the gnarled old giants for a few more cords of stove wood for the owner, too ignorant to appreciate the great patrimony he is sacrificing. And as to the love of saving them, there would be fewer of them today if that were the only consideration.

Financial Considerations Win.

Let us illustrate: A few years since temperance, or so-called prohibition, sentiment began to be agitated in many Southern California towns. Year after year a campaign more or less hysterical, with Ten-Nights-In-a-Bar-Room scenes, and strong appeals to sentiment and sympathy was waged with indifferent success on one side then on the other.

Courtesy Out West Magazine.

But presto! It was discovered that the town without the saloon was securing a class of people which all towns wish to secure to help upbuild and make them move in step to the twentieth century swing. That moment the appeals to sentiment and sympathy ceased, and a cold-blooded consideration of wiping out anything inimical to the best financial interests of the town began to win favor and win votes, and the suddenness with which saloon changed to no-saloon towns surprised all.

"What is there in it?" is the question which springs to the lips of every American.

Now, then, what is there in it for California if she will protect her few trees, and more, if she will plant for the future? To the more observing the answer is plain. To all it is plainer than it was a few years ago. But possibly we may get an idea from a few minutes' discussion.

Helps Keep the Boy at Home.

The cities recognize the drawing power and the absolute necessity of trees in their parks. The beauty spots have a drawing power for all. The farmer's son visits the city and becomes fascinated with its life and the value put upon things beautiful. It appeals to him. The farm home too often has a barren waste about it. There are other features which draw the boy from the farm, but if farm communities join in creating beautiful surroundings, in fostering a spirit of rivalry between each other, and in vieing in producing more attractive roadways and home grounds, I believe a great factor will be added in keeping the boy at home.

"Is that a commercial factor to the farmer?" Ask the orchard or vineyard owner who, for want of help, has been compelled to contract with the wily Jap to secure the gathering of his crops.

Effect on Tourist.

Again. Imagine an Easterner, a tourist homeseeker, looking over the State—from a car window as usual—going north through the San Joaquin valley. He strikes Bakersfield on a warm summer morning about eight o'clock. Nearly all day he rides in that one valley. Here and there occasionally an orchard, but scarcely a large tree visible from the car window. The mountains to the right show in the dim distance an occasional cap of snow. To the left the Coast range is so low on the horizon as to be almost invisible. The great expanse is in many places almost as unbroken as the surface of the sea.

The appearance of a eucalyptus grove or a solitary tree wins his eye almost as quicklly as a passing ship in mid-ocean. He is ignorant, perhaps, of the great wealth-producing power in that section of the raisin, the peach or alfalfa or the dairy. Or that over against the hills are productive orange groves. Before these facts can be impressed upon him he becomes unconsciously prejudiced against the section through which he is passing, and one who would have been a strong factor in the upbuilding of California may go home to influence others against our State.

California with its brown fields—brown the greater part of the year at least—demands more attention as to the breaking up of the landscape, especially in the larger valleys, with trees, so far as possible.

Let Each Do His Share.

If each homemaker would realize this, and instead of planting fruit trees clear to the foundation of his house, with vineyard perhaps in his front yard, and in their stead plant here and there a large growing forest tree, which, as a rule, is far less subject to pests and diseases than the fruit tree, he would surely add greatly to the natural beauty of his neighborhood, and by that means attract to it a class of people believing, as he does, in having things beautiful surrounding them, all of which creates a greater demand in others for that same property. This, in time, begets greater care in orchards and vineyards, which in turn brings greater wealth. Like begets like so that greater care and attention to or-

ALL ABOUT THE

Orange and Lemon

Is told in our new book on Citrus Culture, embracing every phase of the subject from the seedling bud to the final disposition of the fruit in the Eastern market. The largest and best book on the subject ever printed — 50,000 words, 100 illustrations. You will want a copy, which we will send you for the small sum of 25 cents. Remember we are the largest growers of orange and lemon trees in the world.

STEALING ORANGES.

THAT orange grove owners are exasperated by the continual stealing of fruit by hobos, Jap workers, also by well-to-do and upright Eastern tourists, is well known. That the first two above mentioned classes should swipe fruit, causes no discussion, but the tourist who "just picked a few with his own hands so he could tell it back East" is increasing the losses to fruit growers till they are becoming desperate.

A few years since this became so general that one farmer in watching his grove with his shot gun finally killed a Jap in the act of stealing his fruit. Those Pomona growers are now taking up the fight in a more legal way and post the following notice on their places:

> WARNING.
>
> A liberal reward will be paid for the arrest and conviction of any person stealing fruit from this orchard.
>
> San Antonio Fruit Exchange.

P. J. Dreher, secretary of San Antonio Fruit Exchange, also sends to members the following instructions:

After careful inquiry and consulting with the peace officers, I now desire to give directions as to the manner of procedure necessary to fully carry out the desire of the stockholders to secure the arrest and conviction of persons stealing fruit from your premises.

The arrest can be made by any peace officer when he finds the person in the act of stealing the fruit, but in cases where the officer himself does not see the person stealing the fruit, he must have a warrant for the arrest of the offender.

Any owner of the premises or any person who is in charge of the premises and has authority to protect the same against thieves can, under the law, arrest any person found stealing fruit from such premises, and I therefore, advise each and every one of you to co-operate with your neighbors, giving such authority mutually as you deem proper and necessary for your protection, and that each of you who finds any person stealing fruit from the premises under your charge you should at once, yourself, arrest the person or persons, take them to the nearest deputy constable, turn them over to such officer, stating that the person was caught stealing fruit from your premises; said officer will then take charge of the offender and take him to the nearest justice of the peace, to which place you must accompany the party to swear out the warrant and testify in the case.

If there are more than one person in the party, any of them receiving fruit from the person stealing the same are equally liable, so that in case you should find such to be the case and such person or persons accompanying the party stealing to have possession of such fruit, you will arrest all them aud make the complaint against each and every one.

I would advise that the list of officers and their 'phone numbers be posted near your 'phone at the residence and in each and every case where you make an arrest get some one of your family to 'phone to the packing house of your association and ask that the deputy constable at such point come immediately to your place and take charge of the offenders that are under your guard and thus expedite the business and save you the trouble of detouring with such a party to your packing house. The persons appointed as deputies are employed by the exchange and will, immediately upon receiving notice, come to your aid.

I think the members of this organization should use the utmost efforts to see that all guilty persons are arrested and brought to justice, and would caution you to be careful in attempting the arrest of automobile parties, as such might induce you to get into their machine for the purpose of taking you to the justice, but might carry you beyond the confines of the local authorities.

In arresting parties, it is necessary for you to say that you place them under arrest for stealing fruit from the premises of which you are the owner, or of which you have the charge, and demand that they accompany you to the nearest justice of the peace for the purpose of meeting the charge.

* * *

As doubtless the greatest loss comes from tourists and automobile parties, we think a proper suggestion which might help to lessen such evil, is for some growers to devote a tree or a few trees by which a sign something like this might be placed:

> ORANGES FOR SALE.
>
> Oranges from this tree for sale at 40 cents per dozen. Your choice, pick them yourself. Get permit at residence. Any one trespassing on these premises without permit will be promptly arrested.
>
> —OWNER.

Those not owning an orchard on a main road where automobile parties pass continually or real estate wagons drive with possible purchasers, have no idea of the awful inroads made on fruit by such parties. Such parties have no idea of being common petty thieves and often take fruit in the face of the owner but a few rods away. A sign like the above, of frui for sale, would show to them that it is not there for the purpose of being lugged off without price.

GUM DISEASE.

By losing one line out of one item on this page last week, Commissioner Pease was made to say just the reverse of what he wished to say. The article should have read as follows:

The line left out is now in paren thesis:

So much has been reported of gum disease of citrus trees in one or othe of its forms, that I quote from an article on that subject in Bulletin No 8 of the Florida Experiment Station entitled: "The Principal Diseases o Citrus Trees in Florida." "Sweet seedling orange trees are particularly susceptible to Gummosis and (sweet orange stock used for budding on is als liable to this disease. The sour) orange used as stock for budding remains free from attacks, and in Florida its use for this purpose is almos a sure preventive of this disease."

There appears to be quite a deman here for sour stock on this account Hence, speaking from our standpoint those wishing sour stock should procure the seed and raise their stock a home, as we do not admit such stoc from any locality that is infested wit pests not already here.

TRIFOLIATA.

Trifoliata is a native wild orang of Japan, having stout, stubb thorns and beautiful green trifoliat leaves. The wood is much toughe than the common orange and the tre grows more compact and symmetri cal. When planted in open groun with unrestricted root system, it i the strongest growing tree of any c the citrus family; it is also a decidi ous member of the citrus family. I goes dormant in fall, same as the a ple or any other deciduous tree, shec ding its leaves and remaining in doı mant condition until late in th spring, when it then starts off readil and makes a continuous, vigoro growth during the entire summe the fruit is inedible, being nothi more than a mass of seeds with pulp, having a decided resino flavor. The fruit is perfectly roun being one-third the size of o Washington navel.

REMEDIES FOR MEALY BUGS.

In the year 1902 I took charge of 30-acre plantation of pineapples a the pines were bearing, but in the fa all looked sick and were dying o so I sent to the Experiment Statio at Lake City some plants and the reported mealy bugs. I at once o dered 20 tons of tobacco dust for i secticide purposes, and in the ye 1904 I shipped the best crop of pin grown in the neighborhood, and your subscribers will apply 15 pounds per acre as soon as possibl of the best tobacco dust, I feel sati fied he will have no further troubl but in the future he should alwa include tobacco dust in every appl cation of fertilizer.—Florida Agricu turist.

DENATURED ALCOHOL.

The farmers, through whose influ-ce the denatured alcohol act was ssed, have been a good deal disap-inted in that they have seen no imediate results in the way of the tablisning of farm distilleries. e value of this law to the farmers nerally must necessarily be in-rect, resulting in the cheapening of cohol for manufacturing purposes, us developing a large number of nall factories in the smaller towns, id greatly cheapening in time a rge number of articles in common There has been a growing senti-se in the manufacture of which eap alcohol is essential.

'he interpretation of the law by e revenue officials precluded the es-blishment of the small denaturing stilleries. A more liberal interpre-tion was made in July last, under hich a farmer or association of rmers can establish a distillery for e conversion of farm products into natured alcohol.

The revenue officials recommend hat they call a co-operative neigh-rhood distillery, centrally located id patronized by the farmers of the eighborhood, in sections where corn cheap or where there is an amount farm products rich in carbon, such unmarketable potatoes. They be-eve that a distellery of this kind ould be put up for $1000 or $1500, hich would have a capacity of 100 200 gallons per day.

An individual farmer might put up plan for $100 or upwards, but he ould not make very much alcohol. nder the new regulations plants aving a capacity of less than fifty allons in twenty-four hours need no ispection, nor do those having a ca-acity of more than fifty and less ian one hundred gallons, if the reve-ue officers are perfectly satisfied ia the interests of the government ill be taken care of. Larger distil-ries require an inspector.

The new regulations, which went ito effect September 1, and a copy f which can be procured by applica-ion to the Department of Internal evenue, Washington, D. C., are iuch more liberal than those here-ofore in vogue.

We do not expect the establishment f any great number of co-operative istilleries except in locations where here is a large amount of ferment-ble farm products for which there is o cash market. We do not expect hat in time farmers will grow pota-oes largely for the supply of co-op-rative denatured alcohol distilleries. hese potatoes will be grown as they re in Germany, not for the shape or he color of the skin, or smoothness, r the character of the eye, but sim-ly for the production of starch, omething like the old "Paddy's lub" grown in our boyhood, of which man could grow three hundred ushels per acre quite as easily as he an grow one hundred of the market-ble and more tender varities in use iow.

In short, the denatured alcohol act as done all that we expected for the ime it has been in operation, and e believe it will result in the estab-hment of small manufactories in ns and smaller cities, where it ould not be done with taxed alcohol; ht it will in time largely take the lace of gasoline for light motive ower for automobiles, gasoline en-ines and possibly for light in farm omes.—Wallace's Farmer.

A single fir tree cut near Raymond, Vash,. a few days ago, yielded three ogs which scaled nearly 45,000 feet, he market value of the lumber there-rom being $425. At this rate some f the quarter sections of timber land vhich have been selling as high as 50 per acre do not appear to have rought exorbitant prices.—Portland)regonian.

The exports of wheat from the hree great wheat exporting coun-ries of the world.—United States, Argentina and Russia—for the cereal year recently completed, extending from September, 1906, to August, 1907, inclusive, were as follows: United States, 107,648,000 bushels; Argentina, 104,248,000 bushels; Rus-sia, 95,112,000 bushels.

Three-quarters of a million dozen bunches of celery were shipped East during the month of December.

HURST SPRAYERS ON FREE TRIAL

NO-MONEY-IN-ADVANCE. PAY AFTER IT HAS PAID FOR ITSELF.

LET US SEND YOU ANY OF THESE SPRAYERS—to try for 10 days, then if you buy, you can pay us cash or we'll wait till you sell your crop, then you can pay us out of the extra profit. *We pay freight. Wholesale price (where no Agt.)*

Fitz-All Barrel Sprayer

Fitz any Barrel or Tank. High pressure. Perfect agitation, and easy to operate. Brass Ball Valves, plunger, strainer, etc. Automatic strainer cleaner. No cup leathers or rubber packing to be eaten out by the chemicals. Packed like an engine cylinder. Furnished plain, mounted on barrel or on wheels as shown.—Handiest rig ont. GUARANTEED 5 YEARS, and it don't cost you a cent to try it in your orchard. Get one FREE. Remember there are "no strings" to onr free offer. Read below.

Man-Power Potato & Orchard Sprayer

Sprays everything: Potatoes or Truck 4 rows at a time.—Also first-class tree sprayer. Doubles your-crop.—Don't let Blight, Scab, Rot and Bugs cut your crops in half. High pressure from big wheel gives vapor spray. Spray arms adjust to any-width-or-height of row. Hollow steel frame, light, strong and durable. Brass Ball Valves, Cylinder, Strainer, etc. Perfect agitation. 5 YEAR WARRANTY. Pushes easy as is well balanced. Needn't send a cent to get it "on trial." You can get one free if you are first in yonr locality. (See below.) Send coupon or write NOW. Don't wait. Some one will get ahead of you.

Horse-Power Potato & Orchard Sprayer

Most powerful machine made. 60 and 100 gallon tank for one or two horses. Steel axle, one-piece angle iron frame, cypress wood tank with adjustable round iron hoops. Metal Wheels. Spray arms can be adjusted to suit width or height of row. Nozzles adjusted to the row by the feet of the operator as the machine moves along. Brass Ball Valves, Plunger, Strainer, etc. Large air chamber. Big double acting pump gives vapor spray. Runs easy. 5 YEAR GUARANTEE. Try this machine with yonr money in your pocket. Read Free offer below.

FREE—Get a sprayer FREE.—After you have tried the sprayer and are satisfied that it is just as we recommend it, send ns a list of the names of yonr Neighbors and we will write them and quote them price and have them call and see your Machine Work and for every "FITZ-ALL" Sprayer we sell from your list we will credit yon with $2.00 or send you check if yon have paid cash.

For every Man-Power Potato & Orchard Sprayer we sell we will credit you with $3.50 or send check.

For every Horse-Power Potato & Orchard Sprayer we sell we will credit you $8.50 or send you check.

We do all corresponding and selling. All you need do is show the sprayer. Many have paid for their sprayers in this way. This offer is good for only the first order in each locality. Don't delay. Send the conpon or a postcard now.

Live Stock and Dairy

MILK.

MILK is a complete food by itself, and yet how often do we add it as a beverage to an already full meal. It is in one of the most available forms and is easy of digestion. It is extremely soluble and readily taken into the system, The fat of over-rich milks are sometimes too heavy for invalids and babies to take easily. In other words, a three to 3.8 per cent milk is best balanced for the adult stomach. A three per cent milk is perfect for a growing child. Butter fat is the easiest of all fats on the stomach, when used as sweet cream, is excellent as a builder up of body fats, better than the vile cod liver oil for consumptives. The fat is held in the milk in minute globules, and gives the stomach no work to break them up into an emulsion. The greater value of butter fat over the fats of beef and mutton is in this condition. The melting point of butter fat is that of the human stomach, while that of other animal fats are much higher, The animal fats are used in oleomargarine, rendering it less easy of digestion by the human stomach.

Fat.

The fat of milk, cream and butter forms an emulsion that floats along into the intestines and is there picked up and carried into the blood to the lungs for oxygenation. The intestinal absorption of milk is the reason that bad milk brings on bowel troubles in children, and may readily infect them with a generalized tubercular troubles. In the infant this dread disease is rarely found to be centered in the lungs. Milk, also, is the carrier of typhoid fever and diptheria, when it has come in contact with these pathogenic germs through carelessness in handling. The present hue and cry after the dairyman for clean products is founded on the fact that many helpless infants depends on milk for sustenance. I really believe that milk is, today, handled with more care than any other class of food, while it is in the hands of the producer. The fact that milk is the best of cultural mediums for many bacteria forms of growths leads to its contamination very rapidly. Meat is not subject to the bacteria growths, for as soon as it is cold this action stops. Yet, while the animal heat is passing out of it it is the most sensitive time. The control of the filth of the slaughter house lessens the chance of disease from this source.

Take a Look!

Did you ever sit for a few hours around a railroad station and see the ice put into the drinking water on the trains? It is handled with dirty hands by men in greasy clothes, hauled in a dirty iron wheelbarrow, and is often thrown on the ground by the tracks where the dogs and human feet have walked. Then picked up and tossed into the water coolers. Once or twice I have seen it washed by the hose before being put into the coolers. Only once or twice in a good many years. Pullman and tourist and day coaches are all served alike in this matter. In the ordinary hotel and restaurant have you ever sat where you could see the waiters pick up the pieces of butter with their fingers and dab it on the butter plates? Have you ever noticed the waiter wipe the sweat from his brow on the cloth he used the next minute to polish the knife and forks he handed so deftly to you? I could go on and show you a thousand more instances like these, but this is surely enough to point the remark that the average dairyman today is furnishing cleaner milk than the average people that handle food stuffs. While we would not lessen the dairyman's care. No! not for one instant, but can we not raise the cry that will take these things up and make them clean as well?

Consumptives.

This unfortunate class are ever with us in California. We are the Mecca of their travels. In the cities have you noticed how they stand on the curbing and spit into the streets and into the gutters? Fortunately, the scientist has decided that the dried sputum is not as dangerous as we formerly believed. Yet it is not a cheerful sight to see the open fruit stands and the venders' carts standing along side of the curbs where the dust from these same gutters is sifted by ever wind. The milkman has, so far, borne the blame of being the purveyer of tainted food; certainly the dairy that presents the sanitary conditions of many of the back yard of the smaller cities with rubbish, cats, dogs and chickens, is not today in existence.

Character of Milk.

Freshlly drawn milk is silghtly alkaline, and usually sterile from all bacteria taints. It hardly reaches the pail before bacterial growths begin. The warm, mucous membranes lining the teats is alive with bacteria. They are swept into the pail with the first gush of milk. In running a sanitary dairy, the milkers draw these first squirts of milk into an open pail before beginning to use the covered pails. This first milk is poor in quality and is given to the calves. In freshly drawn milk the work of fermentation starts at once, lactic acid is formed and the sugar, then the casien, and lastly the fats are reduced. The old idea that milk was pure if it was freshly drawn from the cow has faded away. The time was when unwatered, unskimmed milk without preservatives or coloring matter, was all that was asked by the consumer. The milk had to be sweet and have no bad odor, and every one was satisfied. Now it must be free from bacteria, or at least, the count must be kept down low. To make this possible, the cow must be kept clean, and her surroundings and food must be sweet. The milk must be handled in a perfectly sterile manner from the time

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

HELP THE COWS

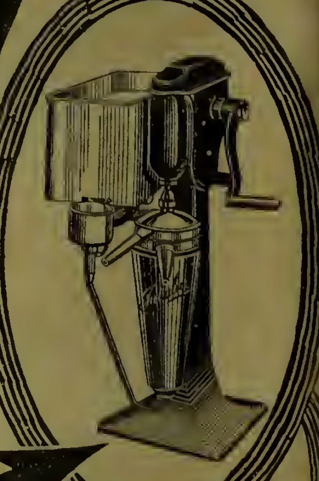
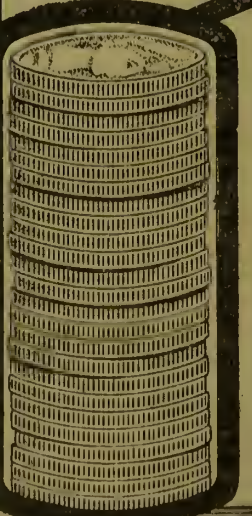
CREAM PROFITS



If you are selling your whole milk to the Creamery you are not getting as much profit from your cows as you should. In fact you are losing 50 per cent. Without increasing your feed bills one penny or milking another cow you can double your cream profits. This is demonstrated by thousands of dairymen and farmers every day in the year.
The Sharples Tubular Separator
gets all the cream in the milk—it skims out every cent of profit, so that you can turn it into cash. Here's one letter that tells the story of how to double your cream profits:

Union Mills, Ind.
GENTLEMEN:—We have a Sharples Tubular. Before we bought it, we had been selling our milk to a creamery at Union Mills, getting not more than $8.00 a month, but since we have the Tubular, we have been getting twice more, and are so satisfied with the Tubular.
MRS. JOHN C. MILLER

Such proof as this ought to convince you that a "**Tubular**" will be a money-maker for you. The extra profit will soon pay for the separator while it will keep right on earning these big profits for years. Write today for our new catalog and **free** copy of that valuable book, "**Business Dairying.**" Ask for book No. 260.
THE SHARPLES SEPARATOR CO.,
West Chester, Pa. Toronto, Can. Chicago, Ill.



of drawing until it leaves the dairyman's hands. Further than that he, of course, cannot control it and it must be left to the woman that rules the home to see that it reaches the family table in perfect condition.—M. E. Sherman.

WHEN AND HOW TO DIP GOATS.

Having read several inquiries about dipping goats, the best kind to use, and the time to dip, I will give you my experience, says W. A. Ayres, in Oregon Agriculturist. I have dipped from 300 to 500 goats every fall for the last five or six years.

The Time To Dip.

October is the best month, but dip anyway. I have dipped as late as January with good results, but it takes more dip as the fleece is long, but dip, no matter what month. Select a sunny day as they dry too slowly if cloudy or damp.

What To Use.

Have a vat or tank, say six feet long at the top and three feet long at the bottom; 18 inches wide at the top, and eight or ten inches wide at the bottom, as a straight up and down tank has too much dip where it is not needed, namely at their feet. Fix a draining pen with a bottom that will drain all surplus dip back into the vat or tank. This is to put goats in after dipping. The vat must be full enough to dip not to let the feet touch the bottom.

How to Dip.

Catch the goat and put it all under except the head. Two can do this better than one. Hold each goat in the solution for one minute by the watch, and don't guess at the time. After the goat has been in the tank fifty seconds hold it with the right hand and grasp its nose with the left hand in such a manner that it cannot breathe or swallow. This can be done in two ways. Then put the goat's head under the dip and hold it there the last ten seconds of the minute. This is done to kill the lice and nits on the head. Then put in draining pen.

Kind of Dip.

I use a poisonous dip as I have not been able to find a non-poisonous dip that will kill nits without dipping twice, which takes too much time. Most persons are afraid to use a poisonous dip. Well, don't drain the goats in the hay mow or on grass that stock is liable to eat and there is no danger. I use a dip of my own make which I find is very effective and does not cost much, prepared as follows: One pound of arsenic, two pounds of sulphur, three pounds of air-slaked lime, one 25-cent package of Dew Drop or Gold Dust washing powder. Mix with three or four gallons of hot water until thoroughly dissolved. Then add water to make 100 gallons in all. Have the chill taken off the water. Some think it is no use to dip this fall if they find no lice. They will find plenty before spring if they don't dip. I dip in the fall, lice or no lice, and again in the spring if I find any lice at shearing time. In the spring I wait until done kidding then dip, kids and all, as the lice will leave the old goats and go onto the kids after shearing. But dip once a year, lice or no lice.

The Government Year Book in a series of articles on "Opportunities for Dairying" says: "Opportunities for dairying are found everywhere in the United States. The different sections of the country have characteristic peculiarities, but all need milk and its products. Success awaits the dairyman who fits his work to the conditions of the place in which he lives. He should know the value of a good dairy cow and how to treat her. He should recognize the necessity of cleanliness from the time the milk leaves the udder until the furnished product is in the hands of the consumer. He should know and meet the needs of his market.

The long delayed irrigation water to District 8, Imperial valley, is now promised for February 15th.

What Horses Need

Conditioning horses for market requires *skill* in feeding. The stomach of the horse is not suited to the consumption of as much rough fodder as is that of the ox. The ration for the horse then, must be more concentrated—largely grains. But food itself is not more important than is a proper *distribution of food* after it's eaten. Thus *digestion* becomes the function to which we look for all satisfactory growth and fattening. Now long-continued heavy feeding may bring stomach derangement, dropsical swellings or even colic. Hence the horse needs a tonic to assist and perfect the digestive process.

DR HESS STOCK FOOD A TONIC

The prescription of Dr. Hess (M.D.,D.V.S.) possesses remarkable tonic properties for either horses, cattle, hogs or sheep. It assists digestion, thus making a greater amount of food available for building bone and muscle or for forming milk and fat. Besides it increases the appetite for roughage. Chemical analysis shows that there is less nutrition lost in the manure when Dr. Hess Stock Food is fed, which *proves* that more of the food is digested. The ingredients contained in Dr. Hess Stock Food are recommended by the ablest medical writers for improving digestion, purifying the blood, expelling waste material from the system and regulating the bowels.

Sold on a Written Guarantee

100 lbs. $7.00; 25 lb. pail $2.00

Smaller qnantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal compound, and this paper is back of the guarantee.

Free from the 1st to 10th of each month—Dr. Hess (M.D., D.V.S.) will prescribe for your ailing animals. Yon can have his 96-page Veterinary Book free any time for the asking. Mention this paper.

Deciduous Fruit Culture

PRUNING THE GRAPE.

PRUNING of grapes is now in order and in some sections is well under way. While the majority of varieties of grapes are pruned short, that is, with the canes cut back to two buds, many varieties so pruned may, without doubt, be pruned longer with proportionately better results provided enough additional plant food and water are available for the vines to draw on. There are some varieties that formerly were pruned short that are now pruned long or half long, in certain localities, with good results. No doubt, the Tokay will prove much more profitable in some places or under certain culture, if it were pruned long and trained on a trellis. We name this variety merely as an example. It may prove to be entirely wrong and ill results may follow, but there is plenty of room for experimentation along these lines. We are of the opinion that many varieties now grown under the system of short pruning may, when intelligently irrigated produce many more, and just as fine grapes, when pruned long.

Starting the Young Vines.

Young vines should be pruned when first planted with enough top to bring the apex 10 to 12 inches above the ground if there is top enough for this purpose. The vine should be tied to a short stake the first and second summer or so, that the trunk will remain straight. At the time of first pruning, it should be allowed to have at least two buds left from the last growth. These make the first forks and should be pruned the following season to two canes of two buds each. The following season, if the vine is a short pruner, these canes should be cut back to two buds each. This will make a head with four branches which, if properly cut from the beginning, will make a symmetrically formed crown. Should the variety be a half long pruner, one of the canes on one of the four arms should be left with about four buds and the balance cut back to two buds as before. The arm on which the half cane is left should also have a stub of two buds left at the base of the half long cane. The following year this plan of pruning may be followed upon the remaining branches, always leaving a stub at the base of each long cane. This stub with two buds furnishes two branches with which to repeat the operation, the long cane with its growth of canes being entirely removed each year. This plan is to be followed in long and half long pruning alike.

When the vines are to be run on a trellis, the long canes are tied to the wires and the growth from the stubs is allowed to grow at will when it will be given the place of the bearing branches at the next pruning time. Another method of training on the trellis is to train permanent branches along the wires and develop crowns at intervals along these branches, and prune each of these crowns as a short pruner.

According to Your Section.

The above direction for pruning a one and two-year-old grapevine, do not apply to the desert sections from Indio to Lower California. In this territory vines make a growth that renders the usual first and second pruning of young vines entirely out of place. When the vine, during the first summer, makes a crown that is as large and strong as a two or three-year-old vine when grown in other places, it is useless to cut it to a one-year-old standard. A twenty-months-old Malaga, for instance, is in size and form, ready to bear twenty to thirty pounds of grapes per vine. There is no need of preventing its doing so. Our advice in these locations, is to prune the vines according to their size and form, irrespective of the age. It is usual for a twenty-months-old Malaga on the desert to be as large and fine in shape as one three years old when grown on the coast or in the great valleys of Central California. In the desert regions, a twenty-months-ol vine will develop rough bark on the current summers' growth for a di- tance of two or three feet from the point on the cane where it started i the spring, with innumerabl branches strung all along the fu length. It would be folly to c away all this finely developed fram when it has all the strength an vigor that a vine of its size r quires. Such vines should be trea ed like bearing vines, as they reall are.—J. W. Mills.

PROF. WICKSON'S LETTER.

Since the ruling on the sulphu question has been suspended and California fruit growers are the winners, temporarily, at least, it may not be necessary to persist in stating "our side" of the question so persistently, yet a nail once driven in holds better if well clinched. The following letter by Prof. Wickson is a clincher, so we give it in full:

My dear President Wheeler: This morning's papers have telegrams stating that Dr. Wiley advocated be fore a congressional committee dipping fruit in a salt solution instead of sulphuring, and showed dried apples, not as light colored, but light enough, and he proposed to have salt used instead of sulphur. On this point I desire to state:

That the recourse to salt solution was suggested and experimented with in California about fifteen years ago and pronounced unsatisfactory for several reasons.

While salt does prevent oxidation and discoloration to a certain extent, it does not produce the light shades the trade demands. While it may be strongly claimed that in the case of dried apples a light brown may be better than a pallid white, producers cannot afford to undertake to reform purchasers' tastes. Producers must please purchasers in aesthetic points or abandon their production.

Though for apples and possibly for pears, where both are cut in rings or small sections, the salt dip may be found practicable from a producing point of view, the salt dip will not do at all for peaches, nectarines, apricots or for apples and pears cut in halves, because the dip in salt water retards subsequent evaporation instead of advancing it as the sulphur treatment does. The result is that this large cut fruit becomes very dark by prolonged exposure in drying and is apt to ferment in the center of the large pieces before the juice is made dense enough by loss of water to preclude fermentation. In this way the proposed salt water dip either perverts or prevents the characteristic California methods of curing fruit in large pieces to preserve as far as possible the natural form.

A liquid dip is objectionable, because of its tendency to become abominably dirty by frequent use for it concentrates dust and other impurities as it is progressively used and becomes soon a method of befouling freshly cut surfaces instead of a cleansing agency.

The suggestion that this could be avoided by constant renewing the di with fresh salt and water should b considered in connection with th cost of providing a large water supply in connection with dryin grounds, which cover acres of lan even in the case of individual pro ducers, and the cost of handling t fruit through a water dipping pro cess. For these reasons, in additio to the fact that the brine dip does not produce the results desired, the recourse to water dipping is impracticable.

If it should be urged that a liquid dip is now largely used for prun and capacious machinery has bee devised to render it practicable and economical, the reply would be that prunes are treated as a whole frui and the pulp is protected by an un broken skin. For this reason th pulp is not affected by a dip as freshly cut peaches, apricots, etc., etc. N analogy can be drawn between th handling of fruits which are cured i natural form and those which are cu into sections.

CODLING MOTH IN PAJARO VALLEY.

W. H. Volck, horticultural commissioner of Santa Cruz county, reports on the codling moth. The year's work has demonstrated the advantage of a local laboratory and experiment station. He says:

"In order to combat the apple worm in this locality, it was found necessary to prepare a special spraying material that would not injure the trees. As soon as it was learned that the foggy summer climate of the Pajaro valley made the use of Paris green and other known remedies for the codlin moth dangerous, practically the whole time was devoted to the discovery of a suitable remedy. With this end in view a large number of different chemicals were prepared and tried with varying degrees of success. Arsenate of lead proved to be the most promising material, and a very careful study was made of this compound with regard to its properties and methods of manufacture.

"The results of these studies are: First, an arsenate of lead has been discovered which controls the worms and yet is perfectlly harmless to the trees; second, a method of manufacture has been invented by which this arsenate can be more cheaply prepared than any other. In the study of arsenate of lead I have been greatly assisted by E. E. Luther, who worked with me during the summer of 1906. Later, Mr. Luther took up the commercial development of the formulas worked out in the laboratory with the result that a thoroughly satisfactory arsenate of lead was placed on the market at 12 cents a pound, which is three cents a pound cheaper than it could be obtained from Eastern manufacturers. This reduction in the price of arsenate of lead will in itself save the orchardists of the two counties more than the cost of the office of the county entomologist each year. More recently the price of lime-sulphur solution has been reduced in a similar way. The work done here on arsenate of lead and the codlin moth has attracted the attention of entomologists not only in the United States, but from foreign countries, and we have entertained a number of specialists who have come here largely to look into the matter. The most gratifying result, however, is the very general feeling among the orchardists that the codlin moth can be controlled, and the way these ideas are being put into practice, is shown by the demand for spraying outfits and materials."

The time is now here for selecting and ordering trees for orchard planting and a practical hint or two may be in season at this time. A new orchard should be planted with well-tested and approved varieties. It is best to select such as have done well in the neighborhood and plant very few by way of experiment of new, lauded and untried sorts, most of which will eventually prove of little value. Choose young and thrifty trees instead of large ones. Young trees are dug with better roots, cost less freight on the railroad, are more easily set out and start sooner into vigorous growth than large trees with mutilated roots. Our experienced planters found long ago that quicker progress is made with young trees, and never order anything else. Growth is attained quickly under our favored conditions with irrigation as an advantage.

Two errors crept into these columns last week, each of which caused us some discontent, to put it mildly. One was a typographical blunder in the item referring to Prof. Wickson's criticism of Dr. Wiley's, wherein we were made to say Prof. Wickson scorns the position of Dr. Wiley that salt water may be used successfully, in place of sulphur, for curing dried fruits. The word scores was printed scorns which every person who knows Prof. Wickson knows is foreign to his nature in any criticism. The other error is where we are made to say the Cultivator has over 12,000 readers. We intended to say 25,000 and over. But such is life in the best regulated newspaper shops.

IMPROVE THE WINTER EVENINGS.

We were reading recently, in Successful Farming, some timely suggestions on the improvement of winter evenings, which appeal to us and ought to appeal also to all farmers and their families. Of course winter evenings give us longer hours for rest and reading than those of any other season of the year. Successful Farming thinks there is no excuse for farmers or their families being ignorant of current news when there are so many well edited agricultural papers which, in these days, are gotten up with a view of presenting each week, or month, the best thoughts of the most practical agriculturists. This is true. Successful Farming might have added there never has been a time when such opportunities were presented for the entertainment of the farm family as there is today. With the rural free delivery, mail is brought to our doors daily; the telephone affords a means of social intercourse, and civic clubs give the opportunity to exchange opinions on all subjects of interest to the farming community. In reference to the entertainment of the young folk we quote what our exchange thinks about it:

"The young people, if they are to become satisfied with farm life, must be given something that will interest them, and sometimes amuse them. Give them something to do that will banish the thought of loneliness of farm life. Not only should young people be well educated, but often they need to be amused. The place for this amusement is in the farm home. Upon the fathers and mothers there rests a grave responsibility in providing for the young folks wholesome pleasure and instruction for the winter evenings. If this be done more will turn their faces toward the farm than away from it."

The Cultivator believes in the idea of giving the young people something pleasing to do. "All work and no play makes Jack a dull boy" is essentially true with farmers' children. And it is not only true of the boy and the girl, but it is true of the men and the women. We all need diversion, something to change the current of our thoughts daily, and we can obtain this through farmers' clubs, reading live papers, farmers' institutes, civic societies that take up living thoughts of leading thinkers devoted to new ideas for the benefit of the farm and home. As never before there is large opportunity to obtain farm literature, agricultural magazines, farm books, station bulletins, etc., that will be helpful in the better understanding of special lines of farming. The successful farmer is a student, although he may not realize it, but every time he endeavors to gain new ideas he is pushing in the right direction.

So we suggest to all readers of the Cultivator to improve these delightful long evenings as they pass; they will be all too few and followed soon by active, late and early grind which will give little opportunity for social or intellectual improvement.

DENATURED ALCOHOL.

Since investigation has been in progress with regard to the possibility of using denatured alcohol successfully for heating and lighting purposes, it has been made reasonably apparent that practical use may be made of the fluid for a number of domestic appliances.

In this connection there has recently been invented a number of different lamps in which it is used, and which it is asserted give reasonable satisfaction. These lamps, says an exchange, "are patterned very much after the usual house lamp, but have the advantage of the incandescent mantle, the same as found in use upon gas jets, thus furnishing a much better light, and one that can be taken about from place to place and no danger of explosion.

"There has recently also come upon the market flat-irons so constructed as to be heated and used like the electric iron, but it has the additional advantage that it may be carried about from place to place, and an electric current is not necessary for its use. It is claimed that a six-pound iron consumes four ounces of denatured alcohol in from one and one-half to two hours, and even at the very high prices now charged for this product, double what it should be, it is said that the average cost for running the iron would be about 2 cents per hour."

If it shall appear, after using these appliances, that they fill the bill perfectly, we may look for a very general use of them, for electric flat-irons are too expensive to use and gas is likewise too dear.

We shall not be surprised to see denatured alcohol brought into general consumption in the next two years, if experiments with it continue to give satisfaction.

RIVERSIDE GETS CONVENTION.

The Southern session of the State Fruit Growers' Convention has been granted to Riverside, and the program is in the making. It will be largely devoted to citrus discussions. At least one-half of the time will be along citrus lines. Commissioner Jeffrey has been in Riverside this week completing the arrangements, and has left a strong committee to care for local arrangements.

It will be a great convention, and as to attendance, it is proposed to make the largest ever.

Cattlemen are sanguine that the plant known as thornless cactus will revolutionize the cattle business in the arid and semi-arid districts of the country. As well known, thornless cactus is vastly different from the ordinary variety, being adapted as fodder and can be raised on cheap lands. It can be made to take the place of dry pasturage and cattle carried over on it when other feed is out of reach. Cattlemen in the central part of the State are jubilant over the prospect for a future cheap feed for their stock.

Our foreign credit is sustained mainly by our farmers. For eighteen years, beginning with 1890, the farmers have not failed to secure a favorable balance, the lowest being 1895—$193,000,000; and the grand aggregate of the balances of trade in farm products for the eighteen years is $6,500,000,000. At the same time our foreign trade in non-agricultural products for the same period has shown an aggregate adverse balance of $456,000,000.—Secretary Wilson.

The farmer's strength comes from his responsibility. No man to boss him; no one to do his thinking for him, he has to develop his own executive ability.

The work on the farm is hard for some men, because they lack a practical knowledge of the principles of mechanics, which would enable them to use pulleys and levers for much of the hard work. Without knowledge along many lines, the work is severe and irksome.

COMMERCIAL VALUE OF ORNAMENTAL TREES.

Continued from First Page.

namentals brings further demand of better care to the producing part of the ranch.

Beauty in Common Trees.

What to plant, how to plant, where to plant are important questions, but not within the realm of this talk. Only permit a hint. Don't strain after strange or unknown or expensive trees simply because they are such. The eucalypts have proven themselves wonderfully adapted to our State. On my own place I have planted an occasional Sequoia, live oak, maple or other slower growing trees. But the masses and general effects are made of eucalyptus, peppers and acacias. My children's children may point up to the Sequoia which I have planted, but while it is growing a few inches, or at best a very few feet, in my life time, the common eucalyptus will grow to be a monarch.

Don't let the idea prevail that the common things with which we are familiar about us may not possess great beauty.

If wealth permits the introduction of strange or new trees, let such service to the State be encouraged. But this appeal is for the lowliest of us to plant some trees in the home croft. Trees which will add to the attractiveness of our State, to our own comfort at noonday, and the night shall be filled with music,

"And the cares that infest the day
Shall fold their tents like Arabs,
And silently steal away."

Agricultural Notes of the Pacific Coast

Northern California

Vineyard pruning at College City is under full swing.

The continual rains in Colusa has been such that the roads have become almost impassable.

Orange trees at Oroville infected with the white fly are being given their second fumigation.

A mine owner above Colusa has been enjoined from dumping debris into the Feather and Bear rivers.

A shipment of plum trees received at Chico were destroyed because they were infested by the borer.

"Fifteen feet of water from Stockton to the sea" is the slogan of the Stockton Chamber of Commerce.

The first steamer of the season reached Red Bluff last week and took away a large amount of produce.

Fifty thousand dollars will be expended in the construction of buildings at the State farm at Davis this spring.

Prof. Jaffa, of the State University, recently addressed Petaluma poultry growers on the Hogan system of laying fowls.

A constitutional amendment revising taxation system of the State will be presented to voters of California next November.

Forest Supervisor of Trinity National Forest will endeavor to secure the eradication of poisonous plants from the grazing area.

Seventy-five per cent of the hop growers of the Sacramento valley have become members of the Pacific Coast Hop Growers' Association.

Orland claims the distinction of being the only place where United States reclamation service has undertaken irrigation of lands wholly under private ownership.

Sonoma county hop growers met last Saturday at Santa Rosa to make more complete arrangements as to joining the Pacific Coast Hop Growers' Association.

Town of Gridley is said to be growing more rapidly than ever in its past history, which is explained by the changing of the wheat farms to orchards and vineyards.

Hop growers about Santa Rosa are thoroughly organized as a member of the Pacific Hop Growers' Association and are willing to join in the movement of the Coast to destroy part of the hops of the Coast if necessary, in order to secure living prices.

Central California

Dinuba rainfall amounts to 2.16 to date.

The Sierra Nevadas have a good coating of snow.

Grain seeding near Bakersfield is progressing rapidly.

Tulare had a most interesting farmers' institute last week.

Prune shippers at San Jose report many inquiries for prunes.

The Coast is said to have about 500 cars of prunes yet to forward.

A large number of wells are being developed in the Wasco district.

Lodi has shipped over 800,000 cuttings of Tokay grapes this season.

A company of Los Angeles capitalists is planting 500 acres of eucalyptus near Tulare.

Over 25,000 acres of grain is being planted on the Miller & Lux ranches near Bakersfield.

The pure-food-sulphur discussion has caused a shrinkage in the orders for peach and apricot nursery trees.

Canners at San Jose report the pack of 1907 as practically cleaned up. The prices received this year are the largest ever.

The Board of Prison Directors has reduced the price of grain bags to 6½ cents; 3000 bags is the limit to any one purchaser.

The Sierra Stock Growers' Association in a convention at Fresno last week elected the following officers for the ensuing year: President, Thomas E. Bacon; secretary, J. D. Collins. These two, with T. J. Simpson, D. C. Sample and J. A. Rogers, comprise the board of directors.

Kings County Poultry Association has elected the following officers: President, M. Bassett; vice-president, C. L. Newport; treasurer, J. R. High; secretary, Howard Lane; assistant secretary, L. H. Pratt; executive committee, C. L. Newport, James Cecil, Mrs. George Slight, E. F. Bradley and L. H. Pratt.

The shareholders of the co-operative creamery at Tulare report a prosperous season and the directors for the coming season are: S. B. Anderson, J. M. Slinkard, William Swall, P. E. Reinhart, M. L. Cottle. The directors organized by electing S. B. Anderson, president; J. M. Slinkard, vice-president, and M. L. Cottle, secretary. W. B. Cartmill was re-elected manager.

Southern California

Redlands has a tree commission.

Redlands has shipped nearly 800 cars of oranges.

The recent glorious rain left the mountains snowcapped.

The rain caused almost complete cessation of orange shipping.

Parcels Post League in Riverside is making a strong campaign.

The Bixby ranch at Long Beach will produce 55 tons of olives this year.

Beet sugar manufacturers are investigating conditions of Imperial valley.

Orange county has become the greatest potato producing section of Southern California.

The promiscuous destruction of shade trees in Santa Ana is calling forth protests on the part of many.

The Anaheim Union Water Company will give a big barbacue on the completion of its big irrigation reservoir.

The Oxnard sugar factory is having its regular annual cleanup and its machinery put in good condition for the coming year.

The acreage of sugar beets already planted at Oxnard is 7000 acres, and is now increasing at the rate of about 400 acres a week.

The Orange County Celery Association met last week to discuss the subject of the California Vegetable Union handling the crop.

All Southern California was given a great blessing in the recent storm, that amounted from 4 to 6 inches, according to the section.

Celery shipping has proceeded more slowly recently owing to a large quantity of Florida celery which has filled the Eastern markets.

The annual meeting of the stockholders of the Azusa Irrigation Company was held at Azusa January 11th. A large reservoir will be constructed this season.

The recent storm gave to Alhambra 4.84 inches; Santa Barbara, 3.25; Redlands, 3.44; San Bernardino, 3.75; Riverside, 3.37; Long Beach, 4.19; Bakersfield, 2.09; Ontario, 6.02; Gardena, 3.03; Ventura, 3.83; Oxnard, 5; Venice, 4.08; Pomona, 6; Pasadena, 6.56; Avalon, 3.61; San Diego, about 1 inch. This makes a total for the season ranging all the way from 6 to 12 inches over the soutnern part of the State.

The Coast

Portland, Oregon, has seventy-eight cars of onions yet to sell.

Portland has inquiries for one shipment of oats to aggregate 10,000 tons.

The Gallatin county poultry show was held at Bozeman, Mont., last week.

Winter irrigation at Clarkston, Wash., has proved exceptionally beneficial.

The Farmers' Union at La Crosse, Wash., have ordered 150,000 sacks for next year's use.

The co-operative creamery at Tillamook, Ore., had a most prosperous year during 1907.

Walla Walla, Washington, has a two-year-old turkey which weighs forty-eight pounds.

Washington appropriates $10.000 annually to aid in the farmers' institute work of that State.

The recent stock show held at Denver is said to be the finest stock show held in that section.

It is said that the Pacific Coast raises hops much cheaper than it can be done in England.

Oregon Experimental Station has just issued a bulletin on the poultry industry of that State.

At the recent goat show held at Dallas, Ore., 150 goats were entered, nearly all being registered stock.

Fruit growers at Seattle, Wash., are still holding their apples for higher prices, offers thus far being too small.

Washington winter school for the farmers held at the State College proved to be very popular this year.

Orchardists at Eugene, Ore., are cleaning their orchards by spraying and destroying badly infected fruit trees.

An effort is being made to establish an experimental poultry plant at the Puyallup Experiment Station in Washington.

Montana wool growers subscribed $10,000 to wage war against the administration's policy of regulating the public range.

The Hazelwood Cream Co. of Portland, Ore., announces a new milking machine which is said to be a complete success.

The Oregon division of the Pacific Coast Hop Growers' Union are making arrangements for a hop growers' convention to be held at Portland or Salem. Over 700 of the 1200 Oregon growers are members.

The Ornamental Garden

FEBRUARY WITH THE ORNAMENTALS.

SPRING is here in earnest this month. Plant pretty nearly everything and get the ground ready for later plantings of the more tender plants. Plant everything in hardy annuals and perennials. Get the roses in their permanent positions All deciduous shrubs, trees and vines should be planted at once. Border plants, helitropes, verbenas and in warmer sections carnations. If your old carnations are more than two years old, replace with young plants. Transplant pansies, put in gladiolus bulbs, tuberoses, callas, anemones, Ranunculus, Iris, etc.

If you didn't plant enough sweet peas earlier, get busy quickly. They will give a nice lot of late bloom if planted now.

Around the borders, in the neglected places of the garden, sow a lot of California poppy seed. They look better than weeds. Try and make it look as if nature in her better mood were smiling on us.

Clean up the lawn. Fill in the dead spots with a bit of healthy turf, cut out of the margins, or a handful of seed scattered and cared for for a time. The lawn is the finest ornament, next to great forest trees, about the home. Don't neglect it. The bare patch at the back door might be made into greensward at this time of the year.

ROADSIDE TREES.

The district attorney of Santa Clara county gave the board of supervisors of that county some desired information on the question, "Who has control of shade trees growing in a public highway?" which may be of interest to others. He says:

"As some persons view the matter, an abutting owner whose estates extends to the center line of the highway has the right to pluck nuts growing on his land within the line of the highway, and so, they argue, must have an equal right to remove the tree itself, or chop it up into stovewood if he so desires. The matters are not the same. The board of supervisors has power to pay persons who plant and cultivate ornamental trees the sum of $1 for every living tree thus planted, when it has attained an age of four years. It is absurd to suppose that thousands of such trees might, on the next day, be felled by the abutting owners.

"Section 2742 of the Political Code provides, that whoever digs up, cuts down or otherwise maliciously injures any shade or ornamental tree on any highway unless the same is deemed an obstruction by the road overseer and removed under his direction, forfeits $100 for each tree. No special privileges are conferred on abutting owners by this section.

Daffodils require to be replanted in fresh soil occasionally. Three years is considered long enough for the bulbs to occupy a bed or patch. The bulbs may be lifted after the death of the foliage, and be immediately replanted, or dried and stored until fall. In very poor, dry soils a dressing of cow manure may be dug deeply into the beds or patches, and a little bone dust worked through the soil nearer the surface.

The Republican State Central Committee have passed a resolution urging representatives in Congress to investigate rulings of the division of chemistry and protect fruit growers' interests.

The Vegetable Garden

WORK FOR FEBRUARY.

IF THE hardier vegetables, such as radishes, peas, beets, onions, lettuce, cabbage and potatoes have not yet been planted, lose no time. February corresponds to "spring" back East—only we don't have to hurry quite as much in our gardening operations. The sun is daily having more power and atmospheric and soil conditions are ideal for all such vegetables as above mentioned.

For the home garden do not make the mistake of planting too much of each kind at one time. Plan for successive plantings, allowing intervals of 20 to 30 days between. This will insure a far more satisfactory result than to try and grow a whole season's supply at one planting.

It is full a month too early to plant seeds of the tender vegetables—such as beans, tomatoes, peppers, cucumbers, etc. Our nights are so cool and the mean temperature is so low throughout March and April that unless one uses glass or artificial heat, it seems worse than useless to attempt to get such tender, tropical stuff early. It usually takes the tenderfoot a couple of years to learn why he can't have ripe tomatoes from the open garden by the first of June. It is true they grow nicely and bloom freely, but the old timer who plants his tomato seed about the last of March or first of April gets fine, ripe tomatoes about the first week in July just as early as his neighbor who planted a month or two earlier. Tomatoes or any of the tropical vegetables require a certain aggregate number of degrees of heat, and until they get it they will not mature their fruit.—Q. A. L.

THE MOON AND VEGETATION.

The widespread belief that the growth of plants is in some mysterious manner related to the phases of the moon has just been put to the test by M. Flammarion, the eminent French astronomer. At dates selected to correspond with the age of the moon he planted a number of common vegetables, such as potatoes, peas, cabbages, etc., and carefully noted the variation in their growth. The results were rather damaging to the theory of the moon's influence, it being quite impossible to connect in any way the development of the plants with the varying phases of our satellite. M. Flammarion, however, is nothing if not thorough, and he has decided to continue his experiments over a longer period and on a more extensive scale.

Convinced that the growth of vegetation depended largely on sun spot activity, M. Flammarion many years ago began systematic observations on a number of trees in the vicinity of his residence, and now after thirty years he claims to have proved that the annual development of certain trees, particularly the chesnut, varies with the solar disturbances. Of more general interest, are his experiments at the Juvisy Observatory, Paris, where by intercepting the sun's rays with different colored glass he has found that while blue glass keeps vegetation back, red glass hastens it in a most remarkable manner. Some plants, indeed, attain under red glass tenfold the height reached under blue, and by the use of certain colors the color and shape of the leaves can be modified at will.—American Cultivator.

CABBBAGE WORMS.

Prof. C. W. Woodworth of the entomological department of the Agricultural College has been spending a couple of weeks in the Fullerton cabbage fields investigating the aphis question, which is proving most perplexing to the cabbage growers. This pest is comparatively easy to control, even a stream of cold water from the hose being sufficient to knock them off and destroy. But in fields where there is no water, this is impossible. The kerosene emulsion or distillate spray is the best and cheapest. In fact, the cost is so very slight per acre that it would be scarcely any burden on any crop of the value of cabbage.

A one per cent distillate mixture would doubtless be plenty strong to kill the pest.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CARE AND MANAGEMENT OF CHICKS.

WE have been asked for an article on feeding and brooding chicks. This we consider the most difficult problem of successful poultry keeping.

We have heard many say that they can hatch their chicks, but oh, how hard it was to raise them; they believed that their stock was not strong or their brooder was not properly constructed. Never stopping to consider that perhaps if their brooder was run proper and the chicks fed right that there would be no trouble. Many factors enter into the construction of a perfect brooder. Of all the brooders on the market not one of them can claim all the good points. Each system has their good points, and we believe if any brooder now on the market or advertised in our columns are run correctly, that success can be obtained.

Temperature Necessary for Chicks.

There are so many different theories in regard to proper temperature that we are going to quote from a bulletin issued by the Cornell University, Itacha, N. Y.:

"That a temperature of 100 degrees is essential to successful brooding of chicks in either large or small flocks. The larger the flock the more important it is that a high temperature is maintained, because greater is the danger of crowding. When the chicks become cold they like to go quickly to a warmer temperature than they could occupy with comfort or safety, if compelled to remain there. Chicks will crowd when they are become cold, if sufficient heat is not supplied. It is but natural that they should. A chick's body temperature is normally about 105 to 106.

"Therefore, a cold chick cannot be blamed for rubbing up against another chick 105 degrees warmer instead of standing alone in a temperature of 80 to 85 degrees. The more the chicks crowd the hotter the pile becomes and, therefore, the more attractive is the source of heat to the chicks on the outside. If a temperature of 100 degrees is maintained, the chicks will spread out of their own accord. They can be trusted to remain in the temperature which is most comfortable to them, which also will be the temperature best suited to their needs. The first sense to be developed in a young chick seems to be the sense of touch, as manifested by the sensation of warmth, which to the chick means comfort and comfort to the chick means home. The first instinct, therefore, to be awakened in the chick appears to be that of location. When once it feels and sees the source of heat and comfort, it will almost invariably return to it.

"The importance of a high temperature in a brooder cannot be overestimated. It is vitally important. Heat brought the chick into the world and lack of heat will take it out of the world. Without warmth chicks do not sleep well. They huddle, they are compelled to stand to avoid being trampled to death. A chick cannot sleep standing. Without sleep chicks do not rest. Without rest chicks cannot grow. Sleep and rest are as important to a chick as to a baby. A large part of the slow growth and mortality with young chicks is caused by lack of sleep caused by lack of heat."

A Word of Warning.

To those using a brooder we do not advise the heating of it to a temperature of 100 degrees only in the warmest place. If you have two departments in your brooder you can heat one to a temperature of 100 and by having a curtain separating the two departments, there will be about 15 degrees difference. This will give your chicks a chance to get into a cool place, if too warm. In heating your brooder to 100, put your thermometer in the warmest place; this will give you several degrees range in your heat.

Pure Air.

"Pure air is even of more vital importance to poultry than it is to other domestic animals, because of the warmer temperature of the bird's body, which normally is 105 to 106 degrees. This high body temperature is maintained by combustion of pure air with the food nutrients contained in the blood. Without pure air perfect combustion is impossible. Without perfect combustion the chick cannot be warmed from within the body and, therefore, will not be healthy or comfortable even in a warm brooder. The chick is a quick growing, quick breathing animal, requiring rapid digestive and assimilative changes, and therefore suffers seriously and quickly when closely confined and compelled to breathe impure air. Leg weariness is almost certain to result from close confinement and heavy feeding, which usually is accompanied by a close and more or less vitiated atmosphere.

"A chick is naturally active, and if given an opportunity to exercise and scratch in a warm, light, clean litter, it will develop strength and grow fast. Good health will not go with close confinement and heavy feeding."

The larger your floor space the easier to keep your brooder clean and to supply same with pure air. Arrange all sunlight possible, it adds warmth, kills germs, keeps the litter dry and provides light, thus encouraging the chicks to hunt for their food. Don't confine the chicks under a glass with the sun shining directly on it, as it will be to hot for them; have brooder so arranged that they can go into the shade when they desire. Don't neglect to lower the temperature as the chicks grow; after the first week they don't require nearly so much heat.

Feed for Chicks.

If you want your poultry to be profitable you must keep the chicks growing from the time they are hatched; by so doing will reach maturity much earlier than to half feed them. There is no profit in keeping a chick just alive, whether it is intended for laying stock or for the market.

Greater care should be taken in feeding chicks than fowls, as chicks have delicate digestive organs and will eat anything that is put before them. So we should be very careful to give them good, sound grain and seed, never feed mushy grain under any circumstances.

First Feed.

Chicks should not be fed until they are at least 24 hours old. As nature has provided for this and they must not be fed until they have had time to absorb the yolk. For the first meal a good food is hard boiled egg chopped fine; (shell and all) mix with about three times the amount of bread or cracker crumbs; this will be a good feed for the first week. If you have not the eggs stale bread (not musty) soaked in milk. This, when fed, should be squeezed out until it is crumbly.

There are a number of baby chick foods advertised in our columns which when fed according to directions are excellent, but in case you are not close to a market where you can get a chick food, you can get a hand mill and grind your own grain. A good feed consists of millet seed, finely cracked corn and wheat, oat meal and broken rice. A good mixture is 10 pounds cracked wheat, 5 pounds cracked corn, 2 pounds millet seed, 2 pounds cracked hulled oats, 1 pound fine beef scrap; to these add a little charcoal.

Green food should be supplied in some form. If you can let them have access to a lawn or a small patch of alfalfa or rye, they will pick all that is necessary. But in case

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

you can't give them this chance, they should have grass or lettuce chopped fine.

Exercise.

Exercise is a necessity, and if your chicks are kept in the brooder and brooder-run, cover the floor with fine litter and scatter your grain in this and make them scratch for it. Keep your chicks comfortable and happy with plenty of wholesome food and fresh water constantly before them, and they will do their part.

* * *

AROUND THE YARDS.

Keep your brooder clean.

* * *

Provide grit for the youngsters.

* * *

Never let the chicks get hungry.

* * *

Never allow your chicks to get chilled.

* * *

No brooder pen should contain over 50 chicks.

* * *

Fresh air is necessary if you would have strong chicks.

* * *

Sunshine will kill the germs and keep the brooder sweet.

* * *

Chicks may live without charcoal, but they will do better with it.

* * *

If properly managed, an incubator may be made to pay for itself in the first hatch. It depends on the operator, however, as much as the incubator.

STATE POULTRY KEEPERS' ASSOCIATION.

The poultry keepers at Hollister are moving toward forming a State organization. The desire seems to be to form it along lines of commercial poultry, rather than the fancy or for show purposes. From the Call we note:

As secretary of the Hollister Poultry Keepers' Association am writing to all the poultry associations in the State that we know of making the same proposal: That we meet at a place most agreeable to the majority on or before the 19th of February, 1908, confer together, elect officers and organize a State association in which we will all be interested, each branch being represented. Please let me hear from you soon stating your preference as to time and place of meeting.

The idea has been advanced that ultimately we could eliminate the middleman both in handling our products and in purchasing poultry supplies, feedstuffs, etc. While we would not wish to hamper nor to dictate as to the action to be taken by the delegates, will say that we realize that many of the associations are organized more especially to hold exhibitions, but we are also aware that where sufficient interest is shown to warrant exhibitions being held, the same interest manifested along other lines will prove greatly to the advantage of the individual as well as the association. While touching on this point we will say that the Hollister Poultry Keepers' Association, having a membership of nearly 80, some 6 months since entered into a contract with a local merchant whereby we purchase all our feedstuffs and poultry supplies at but 2 per cent above what same cost the mrechant, when we take direct from the car regardless of amount purchased, and when taken from the warehouse in lots of 10 sacks or more 2 per cent plus 3 cents per sack or in less than 10 sack lots 2 per cent plus 5 cents per sack, we through our executive committee having access to bills, statements, etc., and power to direct where purchases shall be made or of what grade or brands. We have shipped in 2 cars of beef scraps costing us $2.75 1-2 per 100 lb. at the car, not only this, but with co-operation of Prof. M. E. Jaffa of the State University we have been able to buy feedstuffs on the analysis, this as you will see being of the greatest value to us.

We hope that after a State Central Organization shall be formed each county will be encouraged to form an association, nor need the associations be restricted to one for each

county, at least one county having two associations.

Another point which it might be well to touch upon is the little recognition which has been given our interests by the State, much less than we feel is due to the magnitude of this industry. The apropriations for poultry investigations are not sufficiently ample to obtain the best results, are not in propotion to the importance of the work, and we are confident that with the influence which we could exert through a State association much more liberal appropriations could be secured.

MISTAKES MADE BY MANY POULTRY RAISERS.

I have read in many poultry papers and bulletins where farmers and stock raisers feed cracked oyster shells and other grits to young chicks. In my experience with the feathered stock I made one experiment with grit and oyster shells and find that to feed these articles to young chicks is like feeding an infant with beef steak.

Have none of the readers of poultry journals read the physiology of the human system? Well, let me tell you that with feathered stock it is the same. We have a juice which aids us to digest our food called gastric juice. So have chicks, and at their early age it is not strong enough to digest the grit given them. The grit makes hard crops and the result is death. Feed your chicks wheat, ground corn, rye, etc., until you see them picking grit for themselves. Nature is there to teach them.

LAYS EGGS AT NIGHT.

Tacoma has a hen that does not belong to the union. She belongs to J. Lavergne, and she works overtime, laying an egg every night at 11 o'clock.

Bridget is a little white hen and she works industriously all day long gathering food and scratching up the yard. At night she turns in as early as other hens.

Promptly at 11 o'clock she cackles out the news that she has completed her day's labor and is ready to go to sleep. Lavergne, who has investigated the cackling several nights, has never failed to find the egg.

A BRIGHT CIRCULAR.

One of the latest circulars to reach our desk is issued by Frank E. Baldwin, of San Jose. The circular is well written, and finely illustrated with prize winners in Mr. Baldwin's yards. Also shows a number of his houses and the arrangements of his yards.

Besides giving a list of his winnings, the circular gives a description of his breeding yards for 1908, with the price of eggs from each yard. This circular contains a great deal of information to anyone interested in prize winning White Leghorns, and will be mailed to anyone writing to Mr. Baldwin and requesting it and mentioning the Cultivator.

IOWA PICNIC.

Some where between 15,000 and 20,000 former Iowans will picnic at East Lake park, Los Angeles, on the 22nd of February. A fine program of songs and speeches will be given.

The Annual Studebaker Almanac, which is always eagerly looked for by farmers, is out and being distributed. If anything, this 1908 book will be found more valuable than any of its predecessors. In addition to the regular calendar and almanac features, it contains weather forecasts for each month, an extended list of select recipes and a mass of historical and entertaining matter which will make it interesting to every member of the family. Among these latter features we note plans for various seasons' parties, history of the flag, population of cities, nicknames of presidents, postal rates, weights of grain, maxims of Washington, interest tables, ages of animals, ages of birds, etc. Almost any local Studebaker agent can supply copies of the Almanac, or send direct to Studebaker Bros., South Bend, Indiana, enclosing 2 cent stamp to pay postage.

The Coquille Valley Fruit Growers' Association has been incorporated at Myrtle Point, Oregon. The principal object of the new organization will be the marketing of apples.

S. C. White Leghorns
The Kind
That Pays

For my breeding birds I each year select a number of my handsomest, earliest developing pullets and trap nest them during their entire first laying year. The next season from these I select only those having satisfactory laying records. In my breeding pens are only hens of proven worth in their second and third season, and no bird that has ever shown a trace of disease. Each pen mated eleven hens to one handsome cock. I believe there is not in California a handsomer or better lot of birds and few as good. Can furnish eggs for hatching from these birds at $1.50 for 15, $7.50 per 00 or $60 per 1000. Let me book your order now.

MISSION VIEW POULTRY RANCH
At the Los Angeles County Poultry Association Show, Dec. 7-14, 1907; White Wyandottes, 1, 2, 4. 5 cks; 1, 2, 3, 4 ckl; 1, 2, 3, 4, 5, hen; 1, 3, 4, 5, pul; 1, 2, 3, 4, 5 Pen; MAMMOTH BRONZE TURKEY—1 adult, 1, 2, 3 yearling; 1, 2 young tom; 1, 2, 3, 4, 5 hen; and 2 on ten pullet pen; 1, 2, 3 pullet.
Out of thirteen possible specials I won ten as follows: The Times cup for best display of White Wyandottes, the Los Angeles Produce Exchange $50.00 silver cup for best display of table fowl, the Henry Albers loving cup for best pen of White Wyandottes, Harper & Reynolds Company's handsome carving set for best display of White Wyandottes, the Superintendent's cup for best display of any one exhibitor of any one breed, a California incubator for best display of turkeys, the Association cup for best White Wyandottes, the National White Wyandotte Club cup for best Wyandottes, all the National Wyandotte Club ribbons for best cock, cockerel, hen and pullet; and in the competition open to ladies only; cut glass vase for hen and ten chicks in a large breed; and cut glass salt and pepper shakers for best bantam hen and five chicks.
I had the largest exhibit of White Wyandottes ever made on the Pacific Coast by any one exhibitor. I raise all my birds and keep forty breeding pens and all my hens are trap-nested.
MRS. C. D. HUBBARD, San Fernando.

Starbuck's Barred Plymouth Rocks
We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are laying fine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) We have something to crow about. No Sunday sales or visitors. Orders postmarked after Feb. 12th will be charged $2.50.
Wm. Starbuck & Son. Fullerton

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Grafting Two-Year-Old Trees.

About what time in the year to graft young trees? Mine are two-year-old peach and apricots. What would you graft them to and how would you do it?—Peter Mathason, Fowler.

You do not state what the trouble is with your trees, but we judge they are worthless varieties. We would graft the peaches to some variety that is a moneymaker in your section. Philiips' cling or some other good canning peach. Kelsey and Wickson plums do well on apricot, and if there is any demand for them as a shipping fruit, as there is in other sections, they would be an excellent variety to put on your apricot trees.

Graft your peach trees when the color of the blossom first shows, using a bark graft around the tops of the stumps. Cut the scion with a flat side and tapering to a point. File a twelve penny nail to the same shape and raise the bark with that and slip the scion in, wind the top of the stump with waxed cloth and paint the top with warm wax. The upper ends of the scions should be waxed to prevent them drying out. It is essential that all cracks should be stopped with wax, and after the scions have been inserted four or five days, go over the trees again with warm wax and a brush and give them another coat. At the same time have some paper bags just large enough to slip over them and gather around the stump with a rubber band or tie with a string. Pinch out the two corners of the bag so as to give ventilation. Watch the grafts and when they begin to swell and the green leaves are just coming out, remove the bags, provided the weather is not excessively hot, in which case the openings may be made a little larger by tearing off the corners of the bags so that the sprouts from the grafts will grow out through them.

Young apricots may be grafted the same way. Any trees that do not take the grafts, either apricots or peaches, may be budded in the sprouts that come from the stumps. —J. W. M.

Spineless Cactus.

Can the Cultivator, or any of its readers, tell me where I can get "Spineless Cactus" cuttings or plants? I see no advertisement in Cultivator where it can be gotten. R. C. Foster, Los Gatos.

George C. Roeding of the Fancher Creek Nursery, Fresno, is managing agent for all the Burbank new introductions, and either has the handling of the spineless cactus or can give information as to where it can be secured.

Land for Potatoes.

We have a piece of heavy land which has been in alfalfa for the past six years, and was ploughed last fall. Will Burbank potatoes do well in such soil? Your paper is both interesting and helpful. W. S. Ingham, Highland.

It is very difficult to give an intelligent answer to this question without seeing the land, and knowing more fully what is meant by "heavy land." Usually this means some grade of adobe, in California, but not always. Generally speaking, heavy soils are not favorable for potatoes. The fact that this piece has been in alfalfa would be in its favor, but unless the inquirer knows that it will not be difficult to keep loose and mellow during the life of the crop, I would hesitate to advise its use for that purpose. It is often worth while to do a little experimenting in such cases. Why not try a few rows across one side of this piece, giving the best care posible and if the trial proves successful it will be valuable knowledge acquired without great risk. Try a few White Rose as well as Burbanks. Q. A. L.

To Make Bacon.

Kindly give recipe for curing bacon and hams. How long should it be salted? E., Dinuba.

To cure dry, rub thoroughly with salt, to which a tablespoon of saltpeter has been added to each gallon, leaving on bench or shelf so that brine may drain away, or may be kept in closed vessel. Rub well ocassionally, say once a week, for five or six weeks.

The wet or brine process will take a week less to accomplish the salting. Make a brine strong enough to hold up egg; add for each hundred pounds of meat seven ounces of saltpeter and three pounds of sugar. Pour over meat which has been packed in keg or jar. Change brine in week or two. When salted, smoke to suit.

Gummed Cherry Trees.

What causes cherry trees to gum and what can I do for them? Mine are a year old this spring. Some I wrapped. They are all gummed.—J. J., Penryn.

Of diseases to which the cherry is subject the most common and most troublesome is that which our correspondent describes, the gum disease. The cause of this disease, we believe, has not been definitely determined, but its symptoms are plain; the sap oozes through the bark and congeals in globular masses of greater or less bulk. Unless these are removed, they sometimes induce decay of bark and wood and so prove inj ous to the tree. The remedy is to away, with a sharp knife, the ou bark beneath the gummed porti and cover the wound so made wit varnish of shellac and alcohol. Wh the gum accumulates in the cro formed by the junction of two lin as it often does, it should be clea out, or it forms a receptacle for caying organic matter, which cause the tree to decay at the poin lodgement.—J. I.

Peach Varieties.

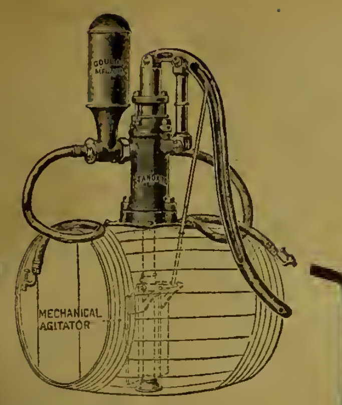
I wish to set out about 50 pe trees of early and late varie Please advise me which kind kinds are mostly planted in our cality. Some fourteen years a bought one dozen of peach trees if I recollect right the nursery called them lemon and orange cli I replanted those and they n amounted to much. When shou plant the trees? C. O., Colton.

The orange and lemon clings fine fruit. For varieties to r through season see Mr. Mills' swer to query on page 74, Januar Buy good trees and plant at onc within the next month.

Stomach Irritation.

I have a horse broken out ove neck and shoulders in small pim He itches very badly and will sc and rub against anything he can to, till he has the skin rubbed c patches. Appetite is good and s strong and in good health other W. E. P., Lindsay, Cal.

Stomach irritation and pro over-feeding. Cut off the grai tirely; rub the pimples with gr adding a small quantity of ca acid to it or use a gall cure if convenient. A home remedy o and lard, equal parts melted tog or of tar, soft soap and alcohol, parts, are good. Clear the h bowels with a good warm bran frequently. Arsenic is the re remedy for this and if the liqu form is too hard to give, get a



Double-Acting Sprayer

With 3-inch brass-lined cylinder, brass-encased outside-packed plunger and brass valves. Large air chamber and long lever. Powerful enough for two leads of hose and four nozzles. Can be placed on end or side of barrel.

Complete outfit, including Pump with suction pipe and strainer, one 25-ft. lead of 1-2 in high pressure spray hose, 6-ft. iron pipe extension and one Seneca spray nozzle (no barrel or agitator) packed ready for shipment for $12.75.

In ordering state whether you want sprayer for end or side of barrel.

of the solution from the druggist and moisten the bran with half an ounce twice a day for ten days, then stop for a week. These troubles are very stubborn to yield. M. E. S.

Best Eucalyptus for Lumber.

Please give best species of eucalyptus for lumber; to be grown on dry land.—A., Fallbrook.

Probabally the red gum (E. rostrata) would be the best. It makes exceedingly fine lumber. Forest mahogany (E. resinifera) is also exceptionally fine. One of Los Angeles' finest buildings, the Grosse building, is finished with it and it has a richness given by few other woods.

Dehorning.

Please give method of treating calves so the horns will not appear. M. P.

The operation is performed as follows, and is uniformly successful, if performed before the calf is three days old: The little animal is caught and gently laid over on its side, in which position it is easily held by one assistant while the operator clips the hair off the trifling prominence on the frontal bone which marks the spot on the uppermost side of the head where the horn would be developed if not interfered with. He then takes his stick of potash, dips it in cold water, and carefully rubs it over the part just clipped for the space of, say, ten seconds. The calf is now turned over, the corresponding portion of the frontal on the other side clipped and throughly rubbed with the moistened potash the same way as the first. By this time the side first treated is dry and ready for a second application of the caustic, which should conform exactly to the first. Follow the same procedure on the remaning side, where the matrix of the embryo horn has been located, and, if the caustic has been properly applied, no horns will ever make their appearance.

Poisonous Plants.

A subscriber at Metz wishes information as to poisonous plants. We haven't the information at hand, but will endeavor to secure it later. Any subscriber with experience will be most welcome if he will come with information.

Flax for Borders.

Will flax grow successfully in California? If so, I think some of the large grain and hay ranches should try a border of say fifty or sixty feet around their crop as a protection from fires. I have seen a very fierce fire come against a border sown with flax in Manitoba which completely died out and in no place had it burned into the flax more than twenty-five or thirty feet.—J. C. R. Hightman.

Flax can be and has been grown in California. A few years since there was a very large acreage sown to it in Merced county and it has been grown at times in other places. It has not, however, become a popular crop in the State. Our correspondent's suggestion that it be grown as a protection against fire around the grain fields, may be a good one and is referred to our wheat men for their consideration.—J. I.

Killing Stumps.

I am told stumps can be killed by boring a two-inch hole down the stump in center in the winter or spring and fill up with coal oil and a little saltpeter and plug it up, and by fall it can be burned. Please give me full particulars. My stumps are mostly oak and some redwood.

There was a report of an investigation of this made by some experiment station. I cannot locate it at present. The conclusion, however, I remember as stated that there was nothing to be gained by the use of saltpeter. My foreman thought that it was a good way, and he treated some large palm and cottonwood stumps. There were some left untreated; the one burned as readily as the other at the end of the year. No doubt, it kills them to use salt on them and prevents suckering. We all know that it is necessary to skin a large stump down to the point where the bark changes to root covering. This causes death of the

roots at once. I kill bamboo when it comes up in the garden walks by cutting it close to a joint to leave a hollow cup and fill this with salt, then pour on water. This ends that particular root's stock growth for several feet back of the sucker.—M. E. S.

Use Stock Dip.

What can a person do to get rid of ticks on cattle? If crude oil is good does it need to be diluted?—J. W. W., Healdsburg.

There is a regular preparation known as stock dip which can be procured at any large pharmacy that will kill ticks. It is not expensive. Crude oil is not satisfactory. The oil dip is often used.

Tuberculosis in Cows.

What are the indications of tuberculosis in milch cows? And can any one make a scientific test, or does it take an expert?—A Sub.

In the early stages it is not detected, except by the use of the tuberculin test. Later the decline of the cow takes place. It grows thin and out of condition, having standing hair. A husky, soft cough when the cow begins to eat; quick, short breathing when hurried into a quick walk. The tuberculin test is simple, but the temperature must be taken accurately and the matter understood. The rise of temperature must be within definite lines, otherwise the cows may be condemned for other troubles. The Experiment Station at Berkeley will send a man competent to test and furnish the tuberculin, if the farmers or dairy men will form a group and give their time to be instructed in the practical use of the test. In turn, this group of men must agree to teach other groups.—M. E. S.

Horse Beans.

Please let me know through the Cultivator when to plant horse beans, how far apart and where I can get the beans.

We find many things in the Cultivator that its worth the price of paper.—J. W. S., Morgan Hill.

Horse beans or, as they are usually called, the English Windsor or broad Windsor, may be planted at once a foot apart and rows three feet apart. They were formerly considered only as horse food, but improvement has made them sought for table use. The seed may be had of seedmen advertising in the California Cultivator.

"Clabber Milk."

I have a cow that gives clabber milk once in a while. She eats hearty. She freshened last June; has not been bred. She has alfalfa hay, bran night and morning; plenty of fresh, clean water. The milk will be all right when we start to milk her, then the milk gets thick and a long piece as long as an inch will be like clabber.—W. R.

In these cases where the udder does not seem to be inflamed, the cause of clabbering of the milk is usually from bacterial infection. Does this cow stand in water or mud? If she does that is probablly the source of the trouble. Give her a pound of epsom salts every other night, until trouble passes away. Are you sure the trouble does not come after the milk is in the pail? If this milk has been in the pail at all, the milk may leave its infection behind it. Please wash them all out with lime water and see if it will not help.—M. E. S.

Lumpy Jaw.

I have a heifer five months old in perfect health otherwise, but with a lump beginning to show about where "lump-jaw" makes its appearance. Can you tell me the symptoms of that disease, and if there is a cure?—C. I. C.

Swelling or enlargement of the jaw bone, either upper or lower, usually attached to bone and skin soft areas appear and usually break. Teeth may loosen and be pushed out of place.

edlands will produce $100,000
rth of pickles and oil this year.

Treatment: This has been until recently almost entirely surgical. When the tumors are external and attached to soft parts only, and early removal may lead to recovery. This, of course, can only be undertaken by a trained veterinarian, especially as the various parts of the head and neck contain important vessels, nerves and ducts which should be injured as little as possible in any operation. Unless the tumor is completely removed it will reappear. Disease of the jawbones is at best a very serious matter, and treatment is likely to be of no avail.

The iodide of potassium is given in doses of one and one-half to two and one-half drams once a day, dissolved in water and administered as a drench. The dose should vary somewhat with the size of the animal and with the effects that are produced. If the dose is sufficiently large, there appears signs of iodism in the course of a week or a few days. The skin becomes scurfy, there is weeping from the eyes, catarrh of the nose and loss of appetite. When these symptoms appear the medicine may be suspended for a few days and afterwards resumed in the same dose. The cure requires from three to six weeks' treatment. Some animals do not improve under treatment with iodide of potassium, and these are generally the ones which show no signs of iodism.

If there is no sign of improvement after the animals have been treated four or five weeks, and the medicine has been given in as large doses as appear desirable, it is an indication that the particular animal is not susceptible to the curative effects of the drug, and the treatment may therefore be abandoned.

It is not, however, advisable to administer iodide of potassium to milch cows, as it will considerably reduce the milk secretion or stop it altogether. Furthermore, a great part of the drug is excreted through the milk, making the milk unfit for use. It should not be given to animals in advanced pregnancy, as there is danger of producing abortion.

Raising Orange Trees.

I would like to know through the columns of your valuable paper, time of year to plant seed for raising orange trees, and if the soil in which the seed is planted should have fertilizer mixed with it. Also how deep to plant the seed.—F. E. B., Lake View.

See Mr. Mills' article on this subject on page 74 of issue of Jan. 16.

Farming By Machinery.

Please give information regarding farming by machinery.—Joseph C. Sherwin, Greenfield.

Well, that's a long subject, and cannot be handled in this department. It is, however, a valuable suggestion and will call for consideration in other departments later.

Cabbage Lice.

How can I kill lice on cabbage?—C. A. R., Los Angeles.

See vegetable department this issue; also Prof. Woodworth's article in issue of Jan. 23.

Sweet Potatoes.

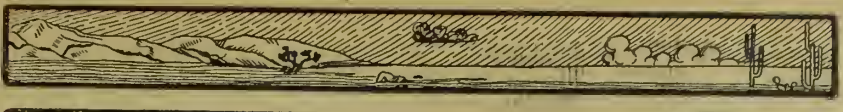
In what manner should a person plant sweet potatoes to obtain the best plants for transplanting? How should the plants be planted and when?—J. E. Thorp, Stockton.

See Mr. Lobingier's article in issue of Jan. 2; also two communications which will appear in the vegetable department of next week's issue. They give the plan as followed in Merced county.

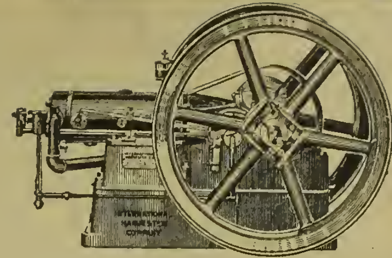
Fumigation.

Will you kindly give me the best formula for a fumigation that will kill the purple scale.—Also can you give information where second-hand fumigation tents may be obtained.—Subscriber, Anaheim.

See Mr. Pease's article on fumigation in next week's issue of the Cultivator for methods of work. As to securing second-hand tents, they should be purchased with caution. Successful work is only done with tents which retain all or a large part of the gas. New tight tents are best.



The
GREAT AMERICAN DESERT *is* DISAPPEARING



THE great ranges are fast being taken up by individual settlers, and thousands of prosperous farmers are taking the place of the few cattle kings that were monarchs of the ranges a score of years ago.

It is the story of the magic touch of water upon the dry land.

I. H. C. Gasoline Engines in Irrigation Enterprises.

If you have not kept yourself posted on irrigating matters, you will be surprised at the important part I. H. C. gasoline engines are taking in the reclamation of these waste lands.

Hundreds of settlers and farmers have no other means of getting water upon their lands than these engines.

These settlers and farmers are cultivating all sizes of farms, from garden spots to "forties" and "eighties" and quarter sections and even larger tracts. They are among the most prosperous farmers in the irrigated sections. They are raising grains, alfalfa and other grasses—vegetables, fruits, etc.

They find that with an I. H. C. engine they can get water in large quantities upon their land, and that they can get it dependably and economically. They find the I. H. C. engine method of pumping more direct, more profitable and more satisfactory than any other means heretofore employed.

I. H. C. gasoline engines are simple, dependable and powerful. They pump water economically, and you will find that they run with very little attention.

If you have an irrigation problem it will pay you to investigate and see what an I. H. C. gasoline engine will do for you.

Vertical engines in 2 and 3-Horse Power.

Horizontal engines (Portable and Stationary) in 4, 6, 8, 10, 12, 15 and 20-Horse Power.

Also, gasoline traction engines, pumping, sawing and spraying outfits.

Call on the International local agent, or write the nearest branch house for catalog and colored hanger.

"JUST MY LUCK."

"That's just my luck," said pessimist Bill,
When his wagon stuck on the side of the hill.
He was half asleep and he did not see
The rut in the road by the old oak tree.
Had Bill been alert with his load of truck
He never would have said, "That's just my luck."

When his cow was killed by an old freight train,
"Thats just my luck, said poor Bill again.
Now the fact is this: there's a broken gate
That Bill failed to fix till it was too late,
And so the old cow with an old cow's pluck
Strayed off to the track just to bring Bill luck.

One wild windy night Bill's big barn was burned—
"That's just my luck, well I'll be durned."
Yes, Bill would swear, but here is the joke,
That Bill's cob pipe was the cause of the smoke.
Whatever we sow we are bound to pluck,
Then like Bill we cry: "That's just my luck."

—American Farmer.

JOSEPHINE'S FATHER.

THE old man frowned.

"Pooh, pooh. The passing preference of the girl of today isn't worthy of any consideration whatever. Yesterday it was dolls; today it is Teddy bears. Sometimes it is lap dogs. Sometimes it's beaux. I suppose my daughter thinks she is fond of you?"

"Yes, sir."

"Just what I expected. You train a girl up in the way she should go and when she's old enough she'll run away with the first smug-faced, rattle-brain that happens along."

The young man involuntarily ran his hand over his chin.

"Do—do you object to my face, sir?"

The old man faintly chuckled.

"I wasn't referring to you personally," he explained. "I'm merely describing the type. Come, let's hear what you have to say. I make it a point never to condemn a man until he's had the chance to defend himself. Go ahead.

"Thank you, sir. I am 26 years old, physically sound and of good habits. I enjoy an excellent income and my father has promised me a house and lot when I marry."

The old man nodded.

"That sounds good," he said. "But what about your family?"

"Oh, you mean during war time. I think we did our share. We had two uncles and three cousins in the civil war and father would have gone to the front in the war with Spain, but mother wouldn't let him."

"When I spoke, I didn't allude to the civil war, sir. The country was rich and powerful then. I refer to the time when it was poor and weak. There was no particular credit in going to the front in the war with the South. So many people went that no one had a chance to feel lonesome. No, sir, I refer to the ever-glorious war with Great Britain, sir, in 1776 and 1812. Do you know what happened on the 10th day of September?"

The young man felt uncomfortable.

"My birthday! Certainly not!"

"I refer to the battle of Lake Erie, sir."

"Oh, yes, the we-have-met-the-enemy battle?"

"Yes. And who do you suppose was there, sir?"

The young man drew a long breath.

"It was Commodore Perry, wasn't it, sir?"

"Commodore Perry. It was my grandfather."

The young man nodded pleasantly.

"Was Commodore Perry your grandfather, sir?"

The old man was speechless for a moment.

"Commodore Perry was not my grandfather—nor my grandmother, either—nor even my uncle Benjamin. Listen to me, young man. My grandfather was at Put-in-Bay."

He uttered the last words impressively and glared at the young man as if to be sure that this momentous fact impressed him properly.

But the unhappy youth was much confused.

"They say it's a fine place for Sunday school picnicks."

"Sunday school picnicks!" cried the old man. "This was no Sunday school picnic. My grandfather, Horatio Gregg, was an active participant in the great sea fight. He told me he was there. He said: 'I was in the fight at Put-in-Bay.' He was old and feeble when he said it. He had lived for many years with my Uncle Hower in Australia. His memory was quite gone, but he hadn't forgotten Perry and Put-in-Bay." He paused and drew a long breath. "And now, sir," he said, "you will understand why we Greggs are a pround race. We stood by our native land in her time of direst need. Can your family match this record?"

The young man shook his head.

"I'm afraid not, sir. One of my grandfathers was a clergeman, sir, and the other was a physician."

The old man waved his hand as if dismissing an audience.

"Then, sir," he solemnly remarked, "you must give up all thoughts of marrying Josephine. The Greggs have too much pride to ally themselves with a family whose patriotic sacrifices date back only to the civil war. Look up your forefathers, sir, and if you find anything report to me promptly. Good afternoon."

"Good afternoon," said the younger man.

The young man went away feeling blue. He had dreaded this necessary interview, and now it had turned out much worse than he expected.

He found Josephine—waiting for him on the side porch.

She read his face as he came near.

"Well?" she said.

"Bad," he answered.

"Did you approach father as I told you?"

"There was very little approach about it. He met me more than half way and bowled me over."

"I'm afraid you blundered."

"No, I didn't. I didn't have time." He frowned at her. Why didn't you tell me about the battle of Lake Erie?"

"Dear me, did he mention that?"

"Did he mention it! why, he pretty nearly fought it all over again. Because I didn't have a grandfather there I'm going to lose you. I know what I'll do—I'll consult a lawyer."

* * *

The old man looked up from his writing.

"How are you, Stewart?" he sai as he waved his hand towards chair. "We don't see much of yo of late? You musn't let that littl disagreement stand in the way of our continued friendship, my boy."

"Thank you, Mr. Gregg." He hesitated. "I am here on a somewha peculiar errand, sir. If you remember our talk last month, you will recall that you advised me to look u the records. I have done so, sir, an the result in one instance is somewhat surprising." He paused an drew the big envelope from his inne pocket. "May I read this communication, sir? It is quite brief."

"Does it concern me?"

"It—it may interest you, sir."

"Read it."

George slowly unfolded the parchment-like sheet.

"Office of the British Admiralt Bureau of Naval Enrollments, No. 1 Curzon street, London—Sir: You esteemed favor of the 27th ult, ha been passed upon and duly certifie to this department. In answer t your request concerning the enrollment of one Horatio Gregg, possibl in the service of H. B. M. during th conflict between Great Britain an the United States, sometimes calle the war of 1812, I have the honor t

inform you that the records of this office disclose the fact that one H. Gregg was enrolled as a member of the crew of his British majesty's ship Detroit, Captain Barclay commanding. With every consideration of esteem I am yours to command, Ponsonby-Hawkins, Secretary."

The old man stared at George.

"Let me see that letter," he said.

George handed it to him.

"It would appear," he slowly said, "that my estimable grandfather was on the other side. I begin to believe he wasn't there at all." He spoke a little sharply. "Of course, this musn't go any farther," he said.

"No," said George.

The old man deliberately tore the letter into little bits and tossed them into the wastebasket.

"How about Josephine?" George promptly asked.

"I'll leave that to Josephine. If she wants you, I have no objection."

"Thank you," said George, and was off like a shot.

He found Josephine waiting for him on the side porch.

She looked up anxiously.

"Well?" she said.

"I have met the enemy," George softly chanted, "and you are mine."—W. R. Rose in the Cleveland Plain Dealer.

"NO GULF OF MUTE SPACE."

The thousand soft voices of the earth have truly found their way to me—the small rustle in tufts of grass, the silky swish of leaves, the buzz of insects, the hum of bees in blossoms I have plucked, the flutter of a bird's wing after his bath, and the slender rippling vibration of water ruuning over pebbles. Once having been felt, these loved voices rustle, buzz, hum, flutter and ripple in my thought forever, an undying part of happy memories.

Between my experiences and the experiences of others there is no gulf of mute space which I may not bridge For I have endlessly varied instructive contacts with all the world, with life, with the atmosphere whose radiant activity enfolds us all. The thrilling energy of the all-encasing air is warm and rapturous. Heat-waves and sound-waves play upon my face in infinite variety and combination, until I am able to surmise what must be the myriad sounds that my senseless ears have not heard.—From Helen Keller's "Sense and Sensibility" in the February Century.

LACQUER FOR BRASS.

Here is a very good recipe for lacquer for brass: Put into a quart jar an ounce of pale shellac, an eighth of an ounce of cape aloes, an eighth of an ounce of powdered gamboge and a pint of alcohol. When this is dissolved strain through cheesecloth. The brass must be perfectly clean and, if possible, slightly warm. Apply with a soft varnish brush.

THE CENTURY.

The February Century brings the first of the promised papers on Egypt, the text by Robert Hichens, the illustrations, in color, by Jules Guerin—author and artist having visited Egypt specially to gather material for this feature. Both have caught and portrayed with rare sympathy of feeling the color, picturesqueness, wonder and mystery of Egypt's ancient monuments.

This issue, too, contains the first of Helen Keller's new essays, entitled "Sense and Sensibility," almost a song of thanksgiving for the wonderful experiences and emotions which are hers through her three senses, and written with much grace and charm of style.

Among other strong features of a strong number is Charles H. Caffin's discussion of "Progress in Photography," with special reference to the work of Eduard J. Steichen and reproductions of Mr. Steichen's interesting portraits of Maeterlinck, Rodin, Duse, Richard Strauss and William M. Chase.

By the side of tombs only kind and courteous words are spoken; let us treat our friends like tombs.

It is so good to be beautiful and so beautiful to be good that it is a sad mistake not to be the one by sheer force of being the other.

What is called luck or fortune, is only the gift of recognizing when the hour strikes, or not taking the hand from the plow until the Angelus sounds.—By the Queen of Roumania.

Malthoid Roofing

Malthoid is the real, original article—made by the original makers of ready roofings. 23 years of practical roofing experience goes into every roll.

Malthoid always makes good.

E. J. Judah, General Representative, Security Bldg, Los Angeles

Now is the time to go for gophers with

Bille's Gopher Poison

The Gophers go for it and it will go for them good and plenty every time

This is a photo of 201 killed in one day on a ten-acre field before they could get back to their holes, with one bottle of BILLE'S COPHER POISON.

Endorsed by Agricultural Colleges and Experiment Stations. Has had greatest success for years in the Middle West, and also here in California last season. It is most attractive to gophers, squirrels, etc, and sure death to them. One among many, Amos. L. Grigsby, Campo, Cal., writes: "I have given it a good test, have used all of the two bottles and have almost exterminated the gophers in my 22-acre tract of alfalfa. You know how thick they can get in alfalfa that is not irrigated. Enclosed find $2.50. Send me two more bottles." If your dealer hasn't it, send $2.50 for 2 bottles (not less than two) express prepaid by us. The ingredients can't be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. Anyway send for circular with affidavit of above killing and a few of many testimonials. Compounded Under Bille's Patent by

Citrus Market

LOS ANGELES, Feb. 5, 1908.

Oranges have not gone forward rap-lly since the recent storms, and it vas hoped this would correct the sit-iation which had been occasioned by ieavy early shipments, but unfortu-iately, the "spell of weather" in the Cast has more than matched our torm, and nothing could be done in narketing fruits. The blizzard effect-ially shut all car doors and prevented edlers and all other dealers from andling fruits, and the markets have een rather flat. It is hopped it will oon reach normal, and clean up the ars on track.

emons.

Lemons are firm and in good de-iand. The amount of winter cuts are eceived and the shipments keep the iarket well supplied.

hipments.

Total shipments of citrus fruits to ate 5840, of which 1062 were lemons. To same date last year 4873, of which 662 were lemons.

NEW YORK, Feb. 3.—Seventeen navels, four lemons, one Arizona and one budded sold. Market active on navels and from 5 to 10 cents higher. Lemons in good demand. Offerings damaged by frost. Weather clear and cold.

THE O. K. ENGINE.

The Ideal Manufacturing Company of Portmouth, Ohio, who are manufacturers of the O. K. engine, has recently established headquarters in Los Angeles at 110-112 North Los Angeles street.

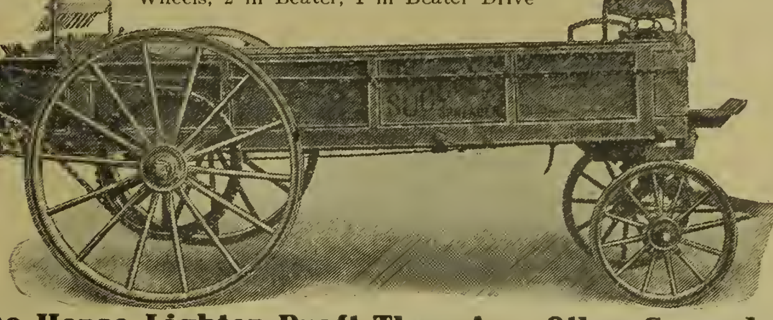
A striking feature of this engine is the simplicity of construction. It is so simple in fact that the inexperienced man who knows practically nothing of engine operation, needs to he shown only once or twice to master its operation. The Messrs. Cartwright & Company, who are the Coast agents, claim it to he the lightest weight engine as well as the most economical in fuel consumption of any engine on the Coast. It can be operated with either gasoline or distillate.

Its lightness enables its heing moved from place to place with perfect ease. It is also adapted to stationary work, such as: Electric lighting, mining, pumping, marine and all kinds of light machine work on the ranch. In other words, it is an all round, high grade engine at a moderate price. The manufacturers guarantee the engine in every particular and proclaim it as their policy to manufacture the very highest grade engine and to sell it exactly as represented. This engine is manufactured in all sizes from 2 to 50-horse power, and the farmer looking for the reliable power, should write the Cartwright Company for particulars of the O. K. Engine.

PILES CURED IN 6 TO 14 DAYS
PAZO OINTMENT is guaranteed to cure any case of Itching, Blind, Bleeding or Protruding Piles in 6 to 14 days or money refunded. 50c

The Success Spreader

Has 7 Sets of Roller-Bearings. 4 in Wheels, 2 in Beater, 1 in Beater Drive



One Horse Lighter Draft Than Any Other Spreader

Extra strong steel pin chain. direct drive. We discarded gear drive on account of breakages. 2 1-8-inch cold rolled steel rear axle. Narrow front trucks to prevent tongue whipping horses and to make easy turning. Extra strong steel or wooden wheels. Staunchest frame on any spreader. Puts all operating strain on rear axle by steel bracing, none on frame. Apron locks to prevent "racing." Worm apron drive runs in oil. Perfect and easy control, perfect work. It's the result of 29 years' spreader building. Catalogue free.

Pumped by

The New Pomona Deep Well Pump Head

Pomona Mfg. Co., Pomona

Riverside, Cal., October 8, 1907.

POMONA MANUFACTURING CO., Pomona, Cal.

Gentlemen:—In reply to yours requesting privilege of photographing our pumping plant which you installed for us last spring will say: You are perfectly welcome to take as many photos as you wish, and as our season for pumping is practically over, it may be of interest to you to know something of what we have been doing with it. We have raised forty inches of water about two hundred and fifty feet, delivering it through a six-inch pipe line to our reservoir about one and one-half miles distant from the well. The pump is driven by a forty-horse power electric motor, and our tests have shown the actual horse power used to be twenty-seven horse power. The pump has worked perfectly all through the season and is in perfect condition today. It has come up to all that you represented it and met our every expectation. Should you wish to refer to our plant at any time, you will always find it open for your inspecition. Yours truly,

RIVERSIDE ARTESIA WATER CO.,

Oranges Everywhere

Oranges! Oranges!
Everywhere!
Train loads of oranges,
Plenty to spare!

Growing on mountain,
Abloom on the plain,
Smiling in sunshine,
Laughing in rain.

Green for a background,
Gold in advance,
Pendant from hranches
Too laden to dance.

Roses and oranges—
My, what a feast
To the eye of the tourist
Just out from the East!

Where they dig through the snowdrift,
And pile it so high
You can't see the sunshine
Or stars in the sky.

There they start with the winter,
Or, late in the fall,
A-blowing their fingers,
And kicking the wall.

And all of the people,
The young and the old,
Spend most of their moments
A-fighting the cold.

O, long dreary winter
As most of us know
With the mercury sleeping
At forty below!

When they keep the fires roaring
To beat back the storm
Then scramble for places
To keep themselves warm.

So our fancy reverts
To the balm and the bloom,
And revels in sunshine
With plenty of room.

Where flowers and verdure,
With carol and song,
Are loving companions
The whole winter long.

—Redlands Citrograph.

SUCCESS

in raising young chicks depends greatly on the feed given to them for the first six or eight weeks.

BY FEEDING

COULSON'S SPECIAL DRY CHICK FOOD

during this early stage you will get the chicks through their time of danger in a healthy and vigorous condition.

THE REASONS FOR THIS ARE MANY—First, each ingredient is carefully selected for its purity, wholesomeness and fitness as a food for a baby chick. Then the strength is considered. A *specially strong* grade of *wheat* is used, as well as *steel cut oats, millet,* and the *best* of *meat.* These are all carefully granulated so that the chicks do not get anything too large, and the grains, etc., are mixed in sufficient variety to *insure* a *perfect balancing* of the different properties which go towards *growth* and *vigor.*

Then again the feed being *free from dust,* can be fed in straw or litter, inducing exercise, and *increasing the strength* and *health of the chicks.*

These are among the reasons why you cannot afford not to feed

Coulson's Special Dry Chick Food

It Insures Your Success

If you do not know where to get it write to us and we will tell you our nearest local agent.

The Culture of Citrus Fruits in California

Written especially for the California Cultivator.
BY J. W. MILLS, RIVERSIDE.

The following article is written for this issue by J. W. Mills, who has been in the service of the State Experiment Station force for many years. Formerly Mr. Mills was in charge of the Pomona station and later was given charge of a greater field in special experiments in citrus fertilization. This work has taken him to all citrus sections of the Southern part of the State. Mr. Mills will now furnish more regularly matter for the Citrus Department of the Cultivator.

CITRUS culture in California has now outstripped all other horticultural industries, exceeding the cured fruit and raisin output over three hundred per cent. The shipments amounting to over 29,000 cars. Many of the groves that sent out fruit last year were just coming into bearing, and many are old groves that are just beginning to improve through more intelligent handling. This latter condition is, in many cases, due to experimentation in handling the groves, but is most largely due to indifference on the part of owners in the past because of low prices received for fruit. The trees became run down and in poor condition. High prices for fruit and advanced values in orange property have impelled the owners to give their groves better care, and a larger production of oranges may reasonably be expected during the next few years. In addition to these elements that bear on the production of the golden fruit, nurserymen have difficulty in filling orders for the standard varieties. Thousands of acres will be planted yearly and when all come into bearing, the citrus industry of California will, no doubt, eclipse all other branches of horticulture.

J. W. MILLS.

Advantage of Location.

There are many locations in California in which specific varieties and types of oranges are more advantageously grown than are others. It is of some importance that these facts should be recognized and taken advantage of. The sections that produce early fruits should plant the varieties of orange that ripen early. Late oranges should be grown where fruits of all kinds mature late. The same rule that applies to apple growing is applicable to the growing of oranges or any other fruit. It is true that the Valencia late, for instance, is a most profitable orange when grown in an early section. Still the finest grade of this fruit is found not very far removed from the coast, so near that it is within its influence. In the interior valleys this orange will turn green after it has matured and before the season of high prices for Valencias has come. A climate that is suited to the development of firstclass softshell walnuts, has proven to be ideal for the growing of Valencias.

Riverside and Redlands navel oranges are famous all over the United States, and buyers who have operated all over the United States and abroad have told us that oranges grown as far inland as the two places above mentioned, are unequaled in appearance and quality. Equally well packed navels from the coast region where the best Valencias grow do not command the price that the inland grown navels do.

Bud Variation.

The Washington navel orange cannot be improved by growing seedlings, but it is prone to bud variation perhaps more than any other cultivated fruit of importance. In this way, many improved types of navels have been secured while, also, many poor types have developed. It is due to this last occurence that many trees bearing inferior fruit are to be found scattered throughout California. This will no longer occur to much extent, as it is now generally recognized that it is important to select the buds from trees that produce a good type of orange.

Types.

There are a number of distinctly different types of the navel orange, being different in appearance, texture and time of ripening. This last quality is very important, as it gives a wider latitude for the culture of this fruit, by giving the early sections a distinctly early orange and also lengthens the market season generally. Certain soils and sections are inclined to produce an orange with a thick, coarse rind, and for such locations those types that have a thin and smooth rind should be planted. For instance, certain locations in the Sacramento valley produce the Washington navel orange with a coarse rind. Thompson's Improved and Navelencia both have a smooth rind and also being earlier than the regular type of navel orange, should be planted in such sections. The desert regions produce a smooth and handsome orange that ripens much earlier than when grown nearer the coast. It is not so important that a smooth type be selected for this region, but the fact that they are also early makes them desirable.

Golden Nugget and Golden Buckeye are remarkably distinct variations of the Washington navel, and while they are an improvement over the original type in texture, they have lost other good qualities. Golden Nugget develops a long stem on which the orange hangs and swings in every breeze, thereby becoming bruised and disfigured, making it anything but a fancy orange. It also has the habit of splitting on the sides from an inch to two inches from the navel, very often one to three or four short splits occuring on one orange. Gum will exude from these slits and make the orange a poor keeper. The color of the orange is a lemon yellow. The navel is almost entirely closed. making the orange smooth and handsome in shape. The quality ranks well with a fancy Valencia, being heavy and of good texture.

Golden Buckeye has not been so extensively grown and its quality under different conditions is not yet determined. It is also light in color, with a faint streak of red in the rind on some specimens. The navel is almost wanting and the skin is so thin that the segments of the fruit are distinctly marked.

These are the chief types of the Washington navel orange, though there are all gradations from oranges of the thinnest texture to that of extreme coarseness to be found in many groves where no care has been exercised in the selection of buds when the trees were propagated. It can be plainly seen from the above statements that careful selections of buds is the first essential in starting a first-class orange grove. Location should determine what variety or type should be selected. Soil has not so much to do with starting and maintaining an ideal orange grove as has the selection of stock, location and subsequent care. The start that is afforded a grove when planting is quite as important.

Planting the Trees.

The plan of planting a citrus grove should not be different from that of any other orchard, when the trees are to be approximately the same distance apart. There is nothing gained by planting on the septuple plan, six trees in a circle and one in the center, over the system of planting in squares. The space occupied by the tops of the trees does not indicate the manner in which the roots are distributed in any kind of an orchard. The roots will fill the soil in an orchard alike, whether the trees be planted in squares, diamonds on the septuple plan. This has been demonstrated and should settle the question of the plan. Every practical orchardist knows that it is easier to cultivate an orchard when it is planted in squares than when planted any other way. These last remarks apply to orchards planted in straight rows. When the orchard is to be planted on a hillside whose slope would cause cutting out of the irrigation furrows, it is more profitable and convenient to plant on contour lines. These contour lines should not give a fall of over one inch to ten feet. This will give plenty of fall for a 300 or 400-foot furrow, while a greater fall will cause considerable washing.

Distance.

Individual opinions differ as to the distance apart that trees should be planted. Trees should not be planted so close that they will crowd when fifteen or twenty years old, and it is not economy to plant them so that the outer branches will be ten to fifteen feet apart when they are thirty years old, unless the object is to plant for future generations. From 20 to 24 feet is a good distance. Navel trees will not crowd at 20 feet till after they are twenty years or more old.

Time to Plant.

It is a generally accepted opinion that orange or lemon trees should be planted in the late spring or early summer. This is immaterial if the location is not too frosty, in which case early planting is best, because it allows the tree to make an early growth and mature some of the new wood. Trees which are planted in April and have the tops removed at the time of transplanting from the nursery will not make as good trees nor will they go through the winter as well as trees that are planted with the entire top as grown in the nursery when they are balled and transplanted with proper care and transplanted as late as the last of July. In frostless locations, or where the frost is not severe enough to injure the tender growth, planting may be done as late as September.

Mr. J. H. Reed, of Riverside, was the first grower to advocate through the press and demonstrate to the experiment stations the advantage of transplanting, as described below:

Trees of one-inch caliper or more should be selected in the nursery and well soaked, so that they may be properly balled. They should be taken directly to the field and placed in the holes previously made for them. The holes should be at least two feet deep and as wide. The dirt should be filled in around and settled with water so that the trees will remain in the holes at the same depth that they grew in the nursery. The ground should be thoroughly soaked for some distance around, so that they will have plenty of moisture to draw from till the next irrigation. Thorough cultivation should follow to prevent the evaporation of the moisture.

Benefit from Cover Crops

BY JAMES MILLS, RIVERSIDE.

Through the courtesy of the State Horticultural Commissioner and his secretary, Mr. John Isaac, we arc able to give in advance of its regular publcation in the State report, extracts from Mr. James Mills' address at the recent State Convention on Cover Crops. Mr. Mills has had wonderful success on the great Arlington Heights properties as a result of his direction, and no small part of it is due to intelligent handling of cover crops. Our thanks are due to Mr. Jeffrey and Mr. Isaac for the courtsey of the advance proofs.

I HOPE that you will give me a sympathetic hearing. I have a large subject. I do not feel capable of dealing with it in the manner in which it ought to be dealt with. It is a subject all of you ought to be studying. You could give days, weeks, months, years to it and not exhaust it. It is a subject which we must know more about if we are going to do our duty by ourselves, our fellows and posterity. It is a subject that will enable us, if we thoroughly understand it, to keep our soils in a real state of fertility, in first class physical condition, in condition to do work for us more and more from year to year, and to be left in condition after we are done with it to do more work for those who succeed us than it did for us when we received it.

The Romans, two thousand years ago, used the cover crop to keep their soil fertile. They did not know just what effect it had on the soil, or, rather, they did not know just what brought that effect about which was apparent to them. They knew that after the growth of a cover crop, a crop of legumes, other crops succeeding them were better than where they were not used.

The Egyptians, for thousands of years, also have used these cover corps. The berseem has been used throughout centuries. No doubt Joseph, when he was premier of Egypt, saw the berseem used year after year and followed with the corn and the cotton and the sugar cane; and those soils have been kept in very good physical condition, a splendid condition of fertility, by th use of these leguminous crops as well as by the overflow of the great Nile river.

The ordinary layman may not be aware that the growth of our crops and the existence of agriculture and horticulture, and, therefore, the existence of life, animal life, on the planet, are dependent upon life in the soil, the existence there of micro-organisms, bacteria—bacteria which, in size, reach from 1-2,500 to 1-25,000 of an inch, and that from 30,000 to 1,500,000 of these are found in a gramme of agricultural soil—15,4 grains of soil. In places, in densely populated cities, where cleanliness is not observed, as in some of the Italian cities, we will find in the same extent the same bit of soil, the gramme, from thirty millions to one billion of these micro-organisms.

They are, I might say, the life of the soil. Without them we can not grow crops. It is, therefore, well for us to remember that the first thing we must do with the soil is to make it a fit habitation for these micro-organisms which labor with us and for us for the upbuilding of agricultural and horticultural industries and, therefore, for the upbuilding of the civilization which we are building and which has been builded before us.

Bacteria Necessary.

We know that bacteria have to deal with the making of our butter. Bactcria makes your milk sour. They give a better flavor to your butter; they give a better aroma to your butter. The Federal department today is actually growing bacteria stronger, more vigorous, more capable of doing the work that these little micro-organisms have to do in the soil and have to do in the arts and in the manufactures, and is distributing them to those who war them in their business for the inocu lation of the soil and for the manu facture of butter. You know that a diseases, typhoid, tuberculosis, ar thrax, lockjaw and kindred ailment are brought about by bacterial a tion. Bacteria are everywhere exer ing an enormous influence upon th conditions that surround man. W sit down to our dinners and we e the crude food that is presented us; I mean crude in that we cann digest it; it cannot enter into and b come part of the blood and the flui of the body until it has been sof ened, until it has been digested that is, converted into forms of ma ter which will make blood and t fluids of the body, that it may be ca ried into the system to build the ti sue and to sustain this organism wi which man does his work.

Necessary to Soil Fertility.

That is true also in the soil, th nothing cau become valuable to pla life but through the activities these micro-organisms. If it be tr that no mineral fertilizer, inert in t soil or put in the soil itself, no pho phoric acid, no potash, nor anythi you may use as a fertilizer, c possibly be of any benefit witho the action of bacteria, then surely devolves upon you as part of wisd to study these things, to study t conditions of the soil that will b develop them and make them healt organisms to grow crops for you, without them you can not grow a crops.

Then soil is but the detritus fr the mountainside and vegeta matter and animal matter in proc of decay, called humus—earth a humus. When we deal with this s cultivate and irrigate and grow c crops of corn and wheat and oats a barley and lemons and oranges a all the deciduous crops, we are ta ing from the soil this humus, wh is the life of the soil. The more cultivate with our cultivators—h in California we do not allow grass to grow in our orchards; keep plowing them. Intense culti tion is our method, and the finer cultivate it the quicker is torn the life of the soil. Now, when humus is exhausted from the soil have again the very detritus t came from the mountainside. It not soil; it is but detritus; it is rock; it is but mineral matter; w out the humus that gave it its which in its decomposition gave organic acids and acted as a st house of oxygen, leaves you a st soil. Now, if that be the case, an is the case, then the part of wis for us is to keep up the supply of mus in the soil because of the b ficial effect that it has on that s for without humus we have no without soil we have no crops, w out crops we have no farmers, without farmers we have nothin

It was in 1891 that Winogra and Warren simultaneously, the in England and the other on the tinent, discovered this little mi organism, discovered just what mission was, discovered that the of the Universe had placed in soil a wonderful little crea whose mission it was to take t the nitrogen from the atmosp and store it up in the soil that might continue the processes for and forever of the growing of c and the feeding of animals, the I say, only in 1891 that they f this.

SAN FRANCISCO SACRAMENTO LOS ANGELES

Where Cover Crops Have Paid

Written especially for the California Cultivator.
BY C. C. TEAGUE, SANTA PAULA.

Mr. C. C. Teague, of Santa Paula, gives a short communication on the value of cover crops. Mr. Teague is manager of the famous Limoneira lemon orchards, which have been remarkably successful. More than any other one feature of large production of these groves is doubtless the system of green manuring.

REPLYING to your favor of recent date, asking me to write an article on cover crops for your special citrus number of the "Cultivator," will say that the calls on my time are such that I shall not at present attempt to write an article. I shall, however, dictate a short letter which will be rather in the nature of a testimonial of the advantages of cover crops for citrus groves.

For years I have been a believer and advocate of cover crops and have been growing them in the groves which have been under my charge for five or six years, with what I consider most excellent results. Hardly any up-to-date grower nowadays will dispute the advisability of planting cover crops in citrus groves, where one has a good water supply, so that the crop and grove can be irrigated. It is, therefore, more a question of the selection of the plant that will make the best growth in the particular locality in which the grove is situated.

Legumes Used.

We have been using fenugreek in our groves for a number of years with excellent results. The plant makes a vigorous, thrifty growth in this locality, is succulent and decays readily when plowed under. It is a good nitrogen gatherer, and has a good root. On the whole, I think it is the most satisfactory of anything I have tried. The same nitrogen-gathering bacteria that work on the burr clover seem to work on the fenugreek, and as burr clover is native to almost all Southern California soils, the bacteria is abundant wherever I have planted fenugreek. We have done some experimenting in the way of planting bacteria in our soils, but have not obtained any beneficial results. The tubercles on the roots have been as abundant where bacteria was not added as where it was.

My observation has been that the fenugreek does not do nearly so well in inland sections as it does near the coast, and that the vetch does better inland than near the coast.

Good for Nitrogen—Better for Humus.

While I believe that leguminous crops are valuable as nitrogen gatherers, I am inclined to think they are still more valuable in furnishing humus to the soil and improving its mechanical condition. It must be obvious that the constant irrigation and cultivation of soils will use up the humus, and as the action of the water is continually washing away the lighter portions in the soil it gets heavy and lifeless, and is not suitable to good plant growth. In one of our groves in particular that I have in mind, where we have been growing cover crops for six years, the improvement in the condition of the soil has been very great. It formerly was very stiff and hard to work. It now works up loamy and light, and the grove has been constantly increasing in thrift.

Complete Fertilizer Also.

In connection with cover crops we have been using a complete fertilizer. We have obtained the best results when the crop was drilled or sowed during the month of October, immediately following an irrigation. After the crop is planted, the ground is furrowed, so that should the winter rains be delayed or deficient, the necessary moisture can be supplied by irrigation. We usually begin plowing the crop under during the month of March and finish some time during April. We have about 700 acres planted to cover crop this year. The early planting has done well and we have a good growth. The late plantings, however, on account of the winter rains being so long delayed, are more backward than they usually are at this time of year.

Can't Afford Not to.

By no other means can humus and nitrogen be applied to soil so cheaply, and the owner of a citrus grove, or any other orchard for that matter, cannot afford not to plant cover crops, if he has a good supply of water. We have fenugreek planted in about 400 acres of walnut orchard this year, and are very much pleased with the way it is doing.—C. C. Teague, Santa Paula.

Orchard Planting and Care

Written especially for the California Cultivator.

BY R. M. TEAGUE, SAN DIMAS.

R. M. Teague, of the San Dimas Nurseries, is known by practically every cit grower in California. He has grown oranges for 25 years and has learned the ga He can grow nursery trees to perfection. We have heard the expression "just good as Teagues," which is highest praise. This explains why his nurseries have come "The largest citrus nurseries in the world."

THE California Cultivator has been good enough to ask me to contribute an article on the culture of the orange and lemon for its Citrus edition. This in its broad sense is rather a large subject, covering in its entirety, the soils and climates, methods of propagation and cultivation, manner of picking and finally, the harvesting and marketing of the product. For the most part these basic principles of our leading industry are pretty thoroughly understood by the owners of orange and lemon groves in this State. The side issues, such as the finding of injurious insects and diseases, the selection of proper varieties, the training and pruning of the trees have also

R. M. TEAGUE.

been rather thoroughly exploited. It would seem that in the evolution of citrus fruits in California, that we have thoroughly mastered the difficulties in a way, and we have tested out all the inferior varieties of both oranges and lemons until we have simmered down to what are really the money making sorts. Strange as it may seem, these have been by a law of elimination reduced down to a very few kinds. In the orange, we have first the Washington navel, then the Valencia Late, Thomson's Improved navel and possibly two or three others, such as Ruby Blood, Mediterranean Sweet and the Paper Rind St. Micheal, with the Mandarin and the Kumquat as profitable novelties; in the lemon, it has simmered down to about two sorts, the Eureka and the Villa Franca.

As an economic proposition, it would seem at this time wise to attempt the improvement of these sorts; that is to say, extend the season of the Washington navel over a wider space of time, improve the shipping and eating qualities of all of these varieties as much as po ble. These endeavors, it would se to me, would lead to larger retu to the growers.

We Must Cover the Whole Year.

There is another thought, howe which has been brought forcibly my mind the past year or two in travels over the State. It is t that with our great diversity of mate and soils, is it not possible in the geographical distribution the orange and lemon, we might that certain varieties will come market at just such periods of year when the planted areas, as understand them at present, find off the market. For instance, exp ments carried on in the Imperial ley have demonstrated that the ange will mature its fruit there n earlier than in Riverside and San Gabriel valley. We have learned that in the Tulare district, the heart of this great San Joaq valley, that the orange and le will ripen its fruit as early as latter part of November, thus crop harvested at that point is p tically off the market at the time Riverside crop is at its best. T diversity of climate, coupled with earlier and later periods at which fruit ripens, has suggested to me thought that when we shall o have thorughly exploited the possi ties of citrus culture in this State, shall learn that over a very large s son of the year the orange will found in a marketable condition one or more points.

The experiments that have b carried on of late in the Imperial ley have impressed me with thought, namely, that there are undeveloped citrus areas which produce a fruit which will be excel by none, at the same time com

ROWING ORANGES BELOW SEA LEVEL.

THE great range of the orange as to latitude in this State often causes wonder, and now comes a elow-sea-level-section to show the reat range as to altitude. Its favor- te location has been claimed to be n the warmer foothill slopes from ne to three or possiblly 4000 feet al- itude.

But out on the Colorado desert in he Coachella and Imperial valleys a section ranging from sea level own to 100 feet below are being aised some of the earliest and some xceedingly fine flavored fruit. For our years the experiment has been ade in a small way and during the ast season other citrus sections ave been taking notice. Hereto- ore, if one thought at all of that sec- on entering the citrus field, it was s to the temperature being too low or ltitude not right or other factors hich bar the consideration.

But fine fruit has been shown from ere this season. Wishing reliable formation the Cultivator asked a ıbscriber, D. G. Whiting, of Heber, or a statement as to his observa- ons. He writes:

"In answer to your request for in- ormation concerning the citrus pros- ects and possibilities of Imperial alley, I will try to give you such cts as are within my knowledge.

"I think a few orange trees, also a w lemons were put out four years go this spring, but I have no per- onal knowledge of what they have one, though I have heard very fav- able reports. Three years ago this ring several parties put out a few ees, mostly for experiment, and all ve exceeded our expectations. With ery little cultivation or care, except give them plenty of water, they re nearly double the size of the verage tree the same age in San ernardino or Riverside county or- ards, and hundreds of orange grow- s who have seen my trees pro- ounce them remarkably vigorous nd healthy.

"The orange trees all bore fruit the ast year, and some of them the sec- nd year, while a Villa Franca lemon ee had more than a box of lemons n it for the third year. None of em were planted in a sheltered lace, though other trees are grow- g up now so as to partly protect em from the more common west inds.

"In regard to temperature, I think e whole valley is practically frost- ss. The young, tender growth on e lemon trees has never been in- red, and the past two seasons to- ato vines have lived and borne uit all winter without protection. s to soil, I prefer a medium be- veen the light and the heavy. Sandy il is easier cultivated, but heavy il is surely the most fertile and roductive.

"As to location or altitude, I know o choice, except perhaps the lower ortions of the valley may in future ears be more liable to an accumula- on of salt upon the surface, though do not think so. My own place is lose to sea level, while a good part f the valley is still higher.

"Our great advantage in orange rowing is in the earliness of ripen- g. Our fruit, though just begin- ing to color Nov. first, were as weet and palatable as oranges rown on the coast are two to four onths later. This enables us to put a ripe orange in the market for the early winter trade; an advantage which is evident to all orange growers."—D. G. Whiting, Heber.

Coachella valley offers much the same conditions as at Imperial, and will some day be heard from with something more than brave talk.

THE CITRUS PROTECTIVE LEAGUE.

THE Citrus Protective League of California was organized at Los Angeles, March 12th, 1906, at a meeting held in the assembly room of the Chamber of Commerce Building, at which there were present 76 accredited delegates, elected by various citrus growing and shipping organizations. The organization was formed for the purpose of consolidating the interests of citrus growers and shippers in matters relating to fruit growing and shipping, and particularly as to questions involving freight rates, icing charges, routing of cars and legislation governing fruit interests. In effect, it was the creation of a department by its members to look after and represent their interests in general matters where organized effort was to be made for better conditions affecting the citrus industry.

An Administrative Committee of thirty was selected as a governing committee from the principal growers and shippers of citrus fruits, who in turn selected an Executive Committee of seven, who with the secretary and manager now direct the operation of the organization.

The membership now embraces 133 of the principal associations and shipping firms, representing 80 per cent of the citrus output of the State.

The League took up with the general freight agents of the transcontinental railways the question of the orange rate to Eastern points and not heads, sending a committee to Mr. Harriman of New York, and Mr. Ripley of Chicago, with the result that on Feb. 6th, 1907, the orange rate was reduced 10 cents per 100 pounds, a saving to the industry of over $27.00 per car in freight charges, or approximately $700,000 per year.

The League is now preparing to meet the issue to be raised by a revision of tariff schedules, with a view to protect our citrus industry from revision with a downward scale, and expects to co-operate with other industries in sharp competition with imports from tropic and semi-tropic countries.

The Citrus Protectice League is not in any sense a political organization, but regardless of all parties, its members and their representatives generally, stand for the principle that United States Senators should be chosen by a direct vote of the people and that the Interstate Commerce Commission should have the power to fix rates and regulate the service of common carriers.

The Citrus Protective League does not seek publicity, but performs its duties quietly and is entitled to the support of the other twenty per cent of growers and shippers, who receive the same benefit from its work, as do its own members.

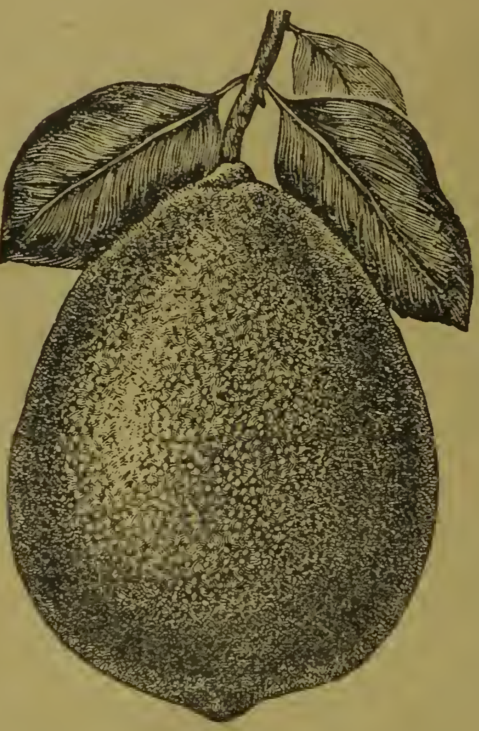
The Wonderful

New Lemon Ponderosa



It is a true ever-bearing variety. On a plant six feet high no less than eighty-nine of these ponderous lemons were growing at one time. It was a beautiful sight to see. The tree was blooming and at the same time had fruit in all stages of development. from the size of a pea up to the ripe fruit, showing it to be a true ever-bearer. It blooms and bears fruit when quite small and you do not have to wait 4 or 5 years to get fruit.

Fruit has been taken from this tree weighing over four pounds. The lemons will average two and a half to three pounds. Now this may seem to you like a fairy tale, but it is a fact that this is the largest lemon known. There is a lemon sold by nurserymen that goes under the name of Large Lemon, but **Ponderosa** is distinct from that variety. **Strong Plants, 25c each, 3 for 50c, 6 for $1.00.**

Los Angeles, Cal., January 30th, 1908.

MR. A. MITTING, Santa Cruz, Cal.

Dear Sir:—The plants by mail were received in good shape. Your stock is certainly first-class and your packing and shipping of orders can't be beat, all of which indicates that you do a first-class business.

I believe that I will get good results from these plants.

Practical Orchard Fumigatio

Written especially for the California Cultivator.
BY S. A. PEASE, SAN BERNARDINO.

San Bernardino county has surely had a capable horticultural commissioner i A. Pease. He has entered the field and done the work of fumigation for grower a way which has won the confidence of growers, and controlled the pests of county. Mr. Pease gives of his valuable experiences in the article, below, and w fumigation is a work which requires experience to accomplish results, at the s time valuable points like following are of great importance.

IN citrus fruit sections of California fumigation is today the generally accepted method for controlling injurious insects that have as yet no efficient parasite. But, notwithstanding the fact that we have been experimenting with hydrocyanic acid gas for a good many years, there is still too much diversity of success in controlling our common pests. This fact is attributable to a number of reasons, the main one of which is trying to do the best work with an insufficient amount of chemicals. Other reasons are—use of imperfect tents and lack of knowledge of the proper conditions necessary to do the best work and get the best results.

S. A. Pease.

If I were starting out anew in the business I should use sheet tents only as they are easily handled and loaded on wagons and gotten into the orchards without carrying them in one at a time as is sometimes the case with hoop tents. The latter, on wagons, require a space between the rows to drive through as wide as the diameter of the hoops. For instance, most of our hoop tents are fourteen feet in diameter and we cannot drive into an orchard with them unless the distance between rows is that great.

Sheet tents up to 35 feet may be made of 6½ ounce drill. Larger than that they should be made of 8 ounce double filled duck; and very large ones say from 65 feet up should have 10 ounce centers where the hardest wear comes.

Oak Extract.

Tents are less liable to mildew if treated with oak extract. Our method is to have a tank large enough to hold the largest tent, built over a furnace. This we fill with water and add sufficient oak extract to make it very dark in color. Bring this liquid to a boil and dip the tents one at a time until they are thoroughly saturated in the boiling liquid. Have a derrick erected over the tank and pull the tent straight up out of the tank and drain, after which spread out on the ground until perfectly dry, then fold and roll them and put away until wanted for use. When in use in the orchards use poles a trifle longer than the height of the trees, each having a rope attached ten inches below the top, tied around a little concavity made around the to prevent the rope slipping.

For very small trees the ropes not needed and two men are suffic to throw the tents. But, for the lar trees it is necessary to have four t throwers; one man to each pole one each for the ropes. The upper of the pole is placed under the e of the tent and the rope given a l hitch over the end of the pole and t and raised six feet from the gro when the men at the ropes pull poles upright and the tent is ea drawn in its place over the tree.

The Method.

There are several methods of ha ling the chemicals—either carry them by hand on trays or in a c or on a light wagon with a horse. will give our method. We use large barrels which are each day fil with water in the orchards; at same time the chemicals are dis uted for the night's work. The c ide is weighed out at the storage b for each orchard aud the acid is ta out in two gallon jugs, as it is eas to handle it in the orchard in t way. For filling the jugs we hav large box lined with lead, like a sn bath tub, and this is set under a r which supports the acid in dru The acid is emptied from the dru into the box below. In the end the box at the lower end is a fau with a lead valve (everything that acid touches is lead.) The valv easily raised by means of a lead r the jugs are placed one at a time der this faucet and filled.

In the field each foreman has a c containing a churn for acid, a keg water, scales, cyanide, dippers, l tern and so forth. For most orcha we use two gallon fumigating ja The jars should always be la enough to prevent the charge boil over under the trees. A jar is w each tent and is transformed to next row as the tent is moved.

Mending.

* * *

We have tent menders who fo up and examine the tents each and patch all holes. All small h are repaired with rubber ti patches the same size as the ca patch. A box is placed under tent, the tissue and cloth are lai place, a damp cloth is placed over patch and a hot flat iron does work, melting the rubber tissue sticking the patch on. This p does not come off in damp or weather. In the past we used a g line stove with a sheet iron cover heating the flat irons. But, we find it more convenient to use ch coal flat irons that keep hot as l as one keeps a fire inside of them. large holes or rents in the tents use sewing machines fastened o the platform of a cart. This ena the menders to easily take the chines from tent to tent in the fi

The Outfit.

We have zinc covered chests w lock for each outfit to keep s graduates, rubber gloves and so fo in, when not in use.

A Straight Talk With Farmers on the Question of Fertilizing

ANTS, LIKE HORSES, MUST HAVE PROPER FOOD.

Farm teams could not do good ork on an hour's grazing at noon- me. They merely need oats, cured ay, corn—something that makes uscle and energy.

The oats, corn, hay, on which they e fed, must also have the right nd of food—cannot grow in large alk, in full and solid grain, with ch, nourishing qualities, from the ttle plant food that is left in an old orn soil.

OIL LOSES ITS BEST PLANT-FOOD FIRST.

If the grocer allows customers to lect fruits and vegetables from his pen boxes, the first comers will take e finest. Nature compels plants to lect the best food there is in the il. They are all greedy for

NITRATE OF SODA.

r they thrive best on that; and hen there is little of it left they windle, simply because they are arving. There is only one thing to o when the nitrate is exhausted: e soil must be supplied with more.

HERE ARE THREE WAYS OF SUPPLYING THE SOIL WITH NITRATE.

1. You can do it by putting in raw itrogen. You have the raw nitrogen n such common fertilizers as weeds, eaves, grasses, tankage, offal, dried lood or fish, or any kind of organic atter.

There are disadvantages in this lan, however, which it is well to learly understand. In the first place, lants cannot eat raw nitrogen any ore than horses can eat cord wood. he plants must wait until nature uts her forces to work and changes he raw nitrogen into nitrate of soda. his work is done by a certain kind f bacteria. These bacteria propa- ate in sufficient numbers only when he weather is favorable. With con- inuous warmth and frequent light ains, i.e., with perfect weather, a art of the work will be done in a nonth or two; but a great deal of the aw nitrogen will not be converted nto nitrate for a much longer time. ow grade fertilizers require a year r two.

You see that the plants will have ut a small portion of the nitrate rom raw nitrogen at the particular ime when they need it. This fact vill be referred to again. It is a vi- al fact.

It is also a fact that much of the itrogen is lost in gases during this rocess of conversion into nitrate. hat is clear loss.

Still another fact of special im- rtance is that in the change from aw nitrogen to nitrate there is often n acid by-product thrown out hich sours the soil and seriously jures the quality of the crop.

When these losses and hindrances re summed up, you will find that all rganic fertilizers are needlessly ex- ensive, and do not give you the rops you pay for putting in.

Nitrate of soda instead of sour- g a sweet soil will sweeten a sour oil. When all its nitrogen is used p the residue of soda is wholesome, s you well know.

II. Nitrate of soda can also be upplied to the soil in "combination." ow let us candidly examine this lan and see whether it is any better han the raw nitrogen plan. This lan is to use what are called "Com- lete Fertilizers," which contain a ertain per cent of soda.

Now, if the per cent were really certain—if it were not uncertain, both in amount and in quality—there would remain but one objection. That objection is very practical. The "complete fertilizer" costs a great deal too much.

FIGURES THAT ARE INTERESTING.

At the New Jersey Experiment Station 195 "complete fertilizers" were analyzed, and their prices tabulated, with the following results: The average price was $34.23 per ton. They contained, on the average, about 16 2-3 per cent of actual plant food. To get a ton of real plant food you must buy six tons of the "complete fertilizer," at an expense of $205.38—for about 20 acres.

Nitrate of soda, every ounce of which is the best possible plant-food, will cover your 20 acres with a bigger and finer crop for much less than half the money.

III. The right way to replenish a worn soil with nitrate of soda is to put in nitrate of soda—the pure stuff, as it comes direct, under Government inspection from the nitrate mines of Chili, where nature completed her great chemical work ages ago.

NITRATE OF SODA GIVES PLANTS THE ESSENTIAL "GOOD START IN LIFE."

You know that pigs and calves and colts must have a good start. If they are not well nourished during the first few weeks they become stunted, and never can make a full and fine growth. You know that is especially true of grains—a backward, dwinding start never can be made up.

Plants require their richest nourishing when their fine spraying rootlets are new and tender. If they do not get it then the rootlets quickly harden to a small size, and will not expand or extend sufficiently for the plants to get full nourishment later on. The loss cannot be made up.

Nitrate of soda, all of it, as soon as you put it in the ground, is ready to be taken up by the tender rootlets, and assimilated into the fibre and fruit of the plant.

With nitrate plants do not have to wait until Nature's little cooks, the bacteria, get a late dinner ready—with the cooks often on a strike because the weather is bad. Ages and ages ago the work was all done—the wasted gases all thrown off—and here is their pure and perfect food.

These three plans—the use of Raw nitrogen, the use of Complete Fertilizers, the use of The Pure Product in Nature made Nitrate of Soda—only need this plain statement of facts to show you which is the proper method.

NITRATE OF SODA MAY BE USED ALONE OR WITH MANURES.

On naturally good soils, nitrate of soda alone is frequently sufficient. If the soil is badly worn, use 100 pounds to the acre. If but partly deteriorated 75 pounds will give splendid results.

RESULTS IN CASH OF NITRATE OF SODA ALONE.

A large number of experiments on Timothy have been made by farmers all over the country and reported to Professor Myers, at 71 Nassau street, New York. Those experiments show that the use of 100 pounds of nitrate of soda to the acre produced an

AVERAGE INCREASE

of 2775 pounds of field-cured hay over the plot where nitrate was not used.

The nitrate of soda cost at the time the experiments were made $2.75. You know what you can get for 2775 pounds of the finest, cleanest, richest, field-cured Timothy. You make from 150 per cent to 200 per cent on your investment in three or four months.

POTATOES, BEETS, CABBAGES, CARROTS, OATS.

Similar experiments—by scores of farmers throughout the country, using 100 pounds of nitrate of soda (alone) to the acre—show average increase per acre of:

Potatoes	3600	lbs.
Beets	4900	"
Cabbages	6100	"
Carrots	7800	"
Oats	400	"

Figure it up yourself and see what an enormous profit you have on the small outlay necessary for 100 pounds of nitrate of soda per acre.

NITRATE OF SODA IS A MAGIC FOR ALL EARLY CROPS.

Peas, beets, lettuce, onions, radishes, beans, sweet corn, all truck gardening that you want early, with a rapid and luscious growth, will get the proper nourishment from nitrate of soda, which is a perfect plant-food ready for them on the instant.

THE ONLY PLANT FOOD THAT CAN BE USED WEEK BY WEEK.

Blackberries, gooseberries, raspberries, currants, as every gardener knows, should not make a rush growth, but a steady and even growth, which means that they must be fed little and often.

A sprinkling of nitrate of soda every week or ten days will show surprisingly fine results.

Nitrate of soda is the only fertilizer that will feed them instantly whenever they require special nourishing.

FOR PLANTING IN SUCCESSION AND RIPENING OF GARDEN TRUCK.

Nitrate of soda is the perfect fertilizer. It is always ready for assimilation. With a trifling outlay for 100 pounds to the acre you have fresh, rich "early vegetables" in September—just as luscious as in June.

THE NEED OF COMMON BUSINESS CARE IN FARMING.

If railroad men and manufacturers neglected their rolling stock and machinery as many farmers neglect their soils, they would go bankrupt in a year. With ordinary care in keeping up the soil, farming becomes a splendid business—the profits doubling and trebling.

FREE LITERATURE ON NITRATE OF SODA.

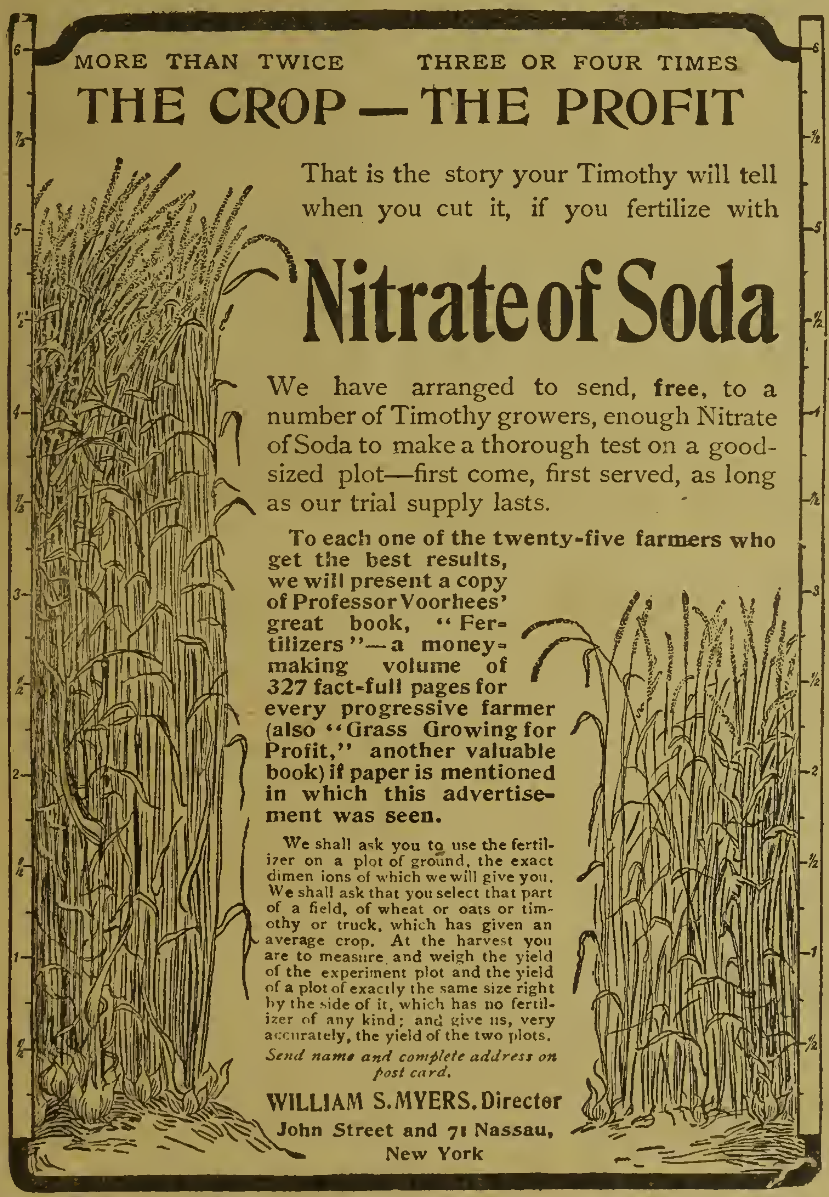
To a limited number of farmers who will make experiments under our directions, we will send the bulletins containing results of Agricultural Station work, which give actual data of trial fertilizing with nitrate of soda. We will also send our handsomely illustrated book of 230 pages on "Food for Plants." It is brim full of such useful and money-making facts as every farmer ought to be familiar with.

We want your word that you will meet our proposition candidly, and conduct an experiment with nitrate of soda carefully and give us the exact results.

The offer, of course, is limited.

Try it for yourself, and learn how much money there is in just a little science properly applied to farming.

If you do not care to make the experiment, or if too many have applied ahead of you, and you still want a lot of general information on this matter of raising big crops, The Nitrate Propaganda, 71 Nassau street, New York, will give this valuable free information.



MORE THAN TWICE THREE OR FOUR TIMES
THE CROP — THE PROFIT

That is the story your Timothy will tell when you cut it, if you fertilize with

Nitrate of Soda

We have arranged to send, **free**, to a number of Timothy growers, enough Nitrate of Soda to make a thorough test on a good-sized plot—first come, first served, as long as our trial supply lasts.

To each one of the twenty-five farmers who get the best results, we will present a copy of Professor Voorhees' great book, "Fertilizers"—a money-making volume of 327 fact-full pages for every progressive farmer (also "Grass Growing for Profit," another valuable book) if paper is mentioned in which this advertisement was seen.

We shall ask you to use the fertilizer on a plot of ground, the exact dimen ions of which we will give you. We shall ask that you select that part of a field, of wheat or oats or timothy or truck, which has given an average crop. At the harvest you are to measure and weigh the yield of the experiment plot and the yield of a plot of exactly the same size right by the side of it, which has no fertilizer of any kind; and give us, very accurately, the yield of the two plots.

Send name and complete address on post card.

Roadside Trees and Orchards

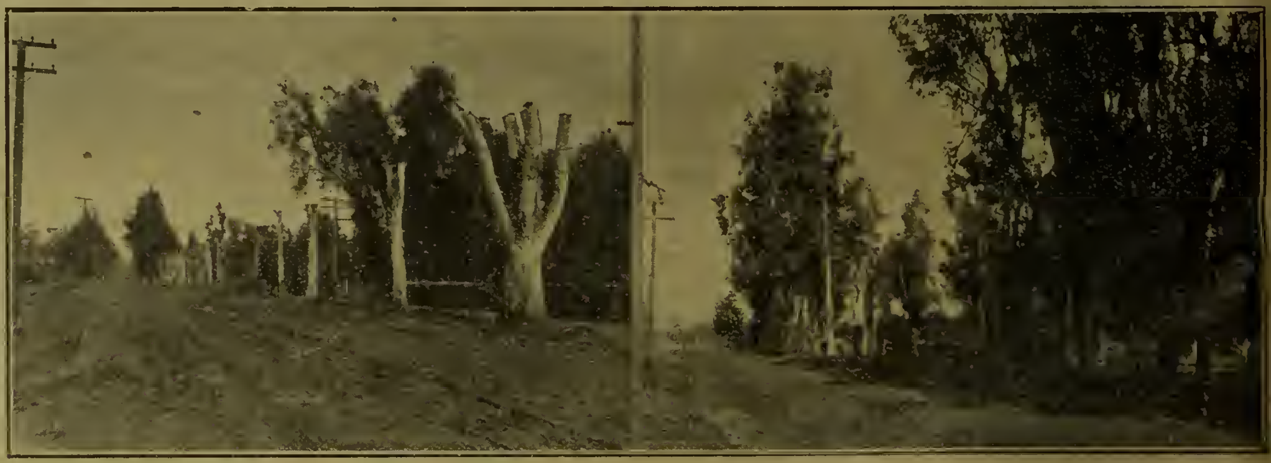
Written especially for the California Cultivator.

BY J. H. REED, RIVERSIDE.

Again it is a pleasure to give space to Mr. J. H. Reed, the veteran Tree Warden of Riverside. Many orange growers begrudge, and justly, the loss from big shade trees along streets. Mr. Reed discusses this question from the standpoint of one who has investgated and worked out the question of beautiful streets with the minimum injury to the fruit trees.

I AM requested by the editor of the Cultivator to reply to the often asked question: "Does it pay to grow roadside trees where such trees greatly injure adjoining orchards?"

I am rather glad of the opportunity to express my opinions on this matter, since it is a much discussed problem of real practical importance to our orange growing sections, and on which I have had occasion to give considerable study. I know the demands of the two distinct interests to be considered are thought by some to be antagonistic, while actual experience. I think, has shown them to be largely reconcilable. Fortunately, we have facts to deal with and not theory.



A row of eucalyptus street trees at Riverside which has seriously interfered with orange trees of the orchard. The picture to t left shows the row with two-thirds of the trees removed and the remainder heavily cut back to form, when they grow o again, a more symmetrical head. Back of the trees may be seen over 400 cords, which much more than paid for the r moval and pruning. The picture to the right shows the work progressing. This cutting of two-thirds of the trees out w greatly relieve the draft on the orchard and at the same time make much more attractive trees. At Rialto a eucalyptus ro cutter is working on this same problem. This machine will run three feet deep in soil and cut roots five inches in diamet Six horses and four men operate it.

The Conflict.

That the popular pepper and rapid-growing eucalyptus, common on our streets, are gross feeders, pushing their greedy roots far into surrounding territory, robbing nearby fruit trees of both food and moisture, is beyond question. With land worth from one to two thousand dollars per acre, this heavy poaching cannot be afforded.

On the other hand, the tree feature of street ornamentation has become a necessity with people of culture and taste, and this class is well in the majority in our orange growing districts, hence there must be some way found to retain our street trees, and yet eliminate, or greatly modify, their damage to adjoining orchards.

The Remedy.

This has been found practical in two or three ways. The first roots of our orange trees are largely near the surface. A deep rooting tree even near by does little damage. For this reason the palm, perhaps, serves this purpose better than most trees generally used on the streets. Where shade is not desired the palm is one of our popular trees. Being a clean tree and free from the objection of robbing crops, is being much planted on our Riverside streets bordering orange groves. Mr. Jas. Mills, manager of the Riverside Trust Co.'s orchards of several thousand acres, a great lover of trees, and interested in beautifying our streets, has recently planted over 3000 palms along the streets bordering their groves. When grown they will be a striking feature of the section of our valley known as Arlington Heights. Where acceptable, the palm probably solves best the problem of street ornamentation along our orange groves without doing injury to them.

Fewer Trees.

But it has been found that even the pepper and other heavy feeders with roots running near the surface may be used along orchard frontages, without serious damage, when for shade or other reasons they are preferred. Street trees are usually planted quite too near together. The pepper and other wide spreading trees should be at least 40 or 50 feet apart, and even a greater distance along acreage property serves the purpose of street ornamentation. The isolated trees we see growing in the open are usually symmetrical, and often grand and beautiful beyond expression because they have room for development. On the street the pepper has usually been planted 20 to 30 feet apart, two or three trees growing where there should be but one. The old eucalyptus rows are found from 6 to 20, and have grown straight up leaving a great number of tall stems to continually scatter their loose bark over street and field. On our Magnolia avenue, in a row of grand blue gums planted 18 feet apart, at one place a tree stands quite by itself, two or three being gone on either side. I measured the spread of this tree the other day and found it over 60 feet one way and 75 feet the other, giving as much shade as three of the others with far less damage from roots and better to the adjoining orchard.

These thickly set rows should be well thinned out even at the expense of temporarily disfiguring the streets. When this is done it will be found many of the remaining trees have been misshapen by crowding and will require severe cutting, but with our fast growing trees the damage will soon be repaired, and we will have a uniform row of permanently shapely trees, with the damage done to adjoining orchards very materially reduced.

Cutting Roots.

This remaining damage can be stopped by a little labor. The roots

Successful Co-operation

BACK in 1886 the writer of this landed in California just before the big boom. Oranges were as ood as gold, bringing to the orchard- t two to four dollars per box. After e boom was over and speculating in al estate was off, we settled down to lanting orange trees on the land left s the legacy of the boom.

Those trees came into bearing about 0. The fruit didn't bring $4. It did- 't bring $3. Worse yet, some didn't ven bring enough to pay freight, and ll some got was "red ink." The wri- er never got the red ink price, but id get a price which did not begin to ay for the care of the orchard.

One year, two years, three years the ame heartbreaking conditions, until a llow dreaded to go home to face his amily with the report that comforts xpected with the "next crop" must till go over another year.

Yes, things were blue, hearts were ching. while packers and shippers ere getting rich, some laying founda- ons for colossal fortunes.

One day word came that a man by e name of Chamblain, of Riverside, ould speak on the subject of co-op- ration in marketing our fruits. "Ev- rybody come."

A so-called co-operative organization ad just ended its existence because f being mismanaged, so that it was s bad as the packers for the grow- rs. This did not give special impe- us to organizing a new concern, but esperation compelled it.

Chamblain presented his case, many f us joined and formed what in time ecame the California Fruit Growers' Exchange, and for 15 years that or- anization has marketed nearly half f the fruit of California, though in he second year of its existence it andled only 23 per cent. of the crop. n the year 1905-06 the exchange andled 48 per cent.; 06-07, 55 per ent., and the coming year will show still greater percentage.

Why has it grown so?

Listen! Last year this organization old for its members fruit which rought the enormous total of $12,- 50,000.00 and on that amount there was not a dollar of loss. The year efore—05-06—$9,936,497.67, on which here was not a dollar of loss. While uring the year 04-5 there was a loss f only $310 on a $7,123,962.54 busi- ess.

In addition to the packing and marketing of the fruits of its growers, the Exchange has been foremost in all he transportation and tariff matters hat affect the citrus fruits industry. In tariff, the cent-a-pound duty on im- ported citrus fruits was obtained with he active assistance and co-operation f the entire Exchange membership. In transportation, the somewhat re- duced icing charges, the reduction of he lemon rate from $1.25 to $1.00 per hundred pounds, and the reduction of the orange rate from $1.25 to $1.15 per hundred pounds, were brought about either by the Exchange alone, or with the assistance of other interested non-Exchange growers through the Citrus Protective League.

It must be noted that the Exchange is not a trust in any sense. It neither seeks to control production, nor arbitrarily to fix prices. It does, of course, undertake so far as possible by a simple method of co-operation, to displace the competition of one grower with another in the matter of packing and marketing their fruit. By purely economical, as distinguished from trust methods, it insures to every grower the full reward of growing good fruit, and to every association the benefit of good grading and packing.

It has carefully guarded the growers' interests in tariff and transportation matters in the past and growers must largely look to the Exchange in the future for further relief and protection in these matters.

It must be remembered also that the economies that have been effected by the Exchange in the packing and selling of the fruit it controls have been large factors in reducing and holding to a reasonable basis the expense and charges for packing and for selling services to such growers as are not affiliated with the Exchange and who sell through speculative shippers.

The Exchange was founded upon the theory that every member is entitled to furnish his pro rata of the fruit for shipment through his associations, and every association to its pro rata of the various markets of the country. This theory reduced to practice gives every grower his fair share, and the average price of all markets throughout the season.

Another cardinal provision of the plan was that all fruit should be marketed on a level basis of actual cost, with all books and accounts open for

Special Prices For Large Quantities
Purchaser to Pay Transportation
Oregon Burbank White Top, Oregon Burbank Low Top, Oregon Garnet Chili, Salt Lake Peerless, Oregon Round Peerless, Red Early Rose, White Early Rose, Early Jackson, Early Champion.
We assure you that the seed Potatoes we send out will be not only the best we can supply, but the best to be had from any source at any price. To that end they will be not only strictly true to name, but hand sorted, selected stock such as any one will be proud to plant.
Tomato Seed
Our stock this year is extra choice selected seed, sure to produce crops that will pay.
We offer the following selected varieties:
GOLDEN QUEEN, the finest of the large, yellow tomatoes.
LIVINGSTON'S PERFECTION, a standard early tomato.
TROPHY, a large and delicious tomato, used almost entirely by the canneries and a very profitable one for the home garden.
NEWSTONE, a grand tomato for canneries and home garden.
EARLY DWARF CHAMPION, very early for home gardening use.
PONDEROSA, almost seedless, a grand tomato for canneries and home gardens.
EARLIANA, a very early new tomato, very profitable tomato for the early market.
All the above varieties per packet 3c.
If wanted in ounces or quarter pounds and pounds or larger quantities, kindly send us a list of your wants and we will be pleased to quote your our lowest prices.
If you want us to grow your tomato plants send us a list of the varieties and quantities that you want, and we are positive that we can save you money.

Pruning the Lemon

Written especially for the California Cultivator.

BY B. J. JONES, SAN DIMAS.

Mr. B. J. Jones, of San Dimas, who gives of his experience on pruning lemons, i the following article, has been with the Department of Plant Pathology of the Stat University for three years as a field expert in both deciduous and citrus fruits. H has just completed eight months of work as a field man of the San Dimas Lemon As sociation, assisting with the various details of field culture and working with the d eases and pests. Mr. Jones has furnished several articles for Cultivator readers.

THE pruning of lemon trees goes into the category with fertilizing, cultivating and other details of field practice which are a part of the great commercial scheme for increasing productiveness. Few can afford to trim orchard trees for the sake of appearance, but for the sake of increased production few can afford to withold it. Long ago it was recognized that this was of enormous value in aiding the setting and developing of fruit. With this object in view many systems and details have been worked out and every possible variation is now in evidence.

At present there is a great tendency to increase summer production by reason of the better prices prevailing at this time of the year, and in connection with fertilizing and other practices, the pruning has come to be regarded as an important factor in bringing this about. It is certain from experience that an unpruned lemon tree while bearing more or less throughout the year, has a tendency to mature its greatest crop during fall and the winter. Since one of the objects of pruning is to break up the natural tendencies, the time and method of doing it is a most promising field for a readjustment which will increase the output. This proposition has already been exploited by many growers, and often with considerable success.

So far a general rule is not available, and it is probable that it never will be, for north and south, coast and interior lemon growing communities will demand a considerable variation as they do in other details of culture. It appears that this is a problem for each community, and also for each of the commercial varieties of fruit, and should be studied by each grower with reference to what others are doing along these lines and a later adaptation to his particular neighborhood.

Four Systems.

A study of past and present methods of training lemon trees shows what we may call four types or systems: The old upright method, the open center, the flat top and the higher top with excessive growth thinned out. The first of these has, of course, been discarded, and the only examples we have of it are the old trees in small blocks or in yards, standing tall and stately and upright like ancient apple trees, the lowest fruit nearly out of reach and the highest often twenty feet higher.

The typical open center has nearly disappeared also, and diligent search is required to find good examples of it.

The flat-topped tree is a direct reaction against the old scheme, and is intended to keep the entire tree within reach from the ground, or at most, from very short ladders. This may be called a shorn tree and can then be made to include the rounded top, for there is every variation between the two, and the object is practically the same. Extremes of this style show trees shorn across the top as low as six feet from the ground. There is a constant struggle to produce suckers and vegetative gro from the top and the tree soon comes as dense as a thatch, its fru ing wood dangles at the sides like weeping willow, and much of th fruit reaches the ground before coming to size, and is a constant prey t brown rot.

Evidently, the desire of the builde of such a tree is to have the frui entirely within reach, literally stickin out to be clipped off easily and rapid without the use of ladders or othe hindrance to the pickers. It doe not seem to be natural for fruit t grow thus entirely exposed, for it seldom found that lemons protrud from such a tree in the profusio necessary to get a good yield, for th actual bearing surface is small, an what few do venture into such exposure are likely to be burned by th summer sun. The advantages of low a tree are more than offset the disadvantages, for there is nc sufficient bearing surface until it very large, and this must come late ally, causing it to occupy mo ground than is warranted under pre ent conditions. Much of the fruit lost or injured in quality by conta with the soil, and there is much lo through rot. A comparison of th tree with the old style, also gives good lesson in gum disease, fo while there are very few cases o curing on the former the latter is u usually susceptible. It is nearly im possible to work the soil under it thing which is imperative in the co trol of this trouble.

The Best Plan.

The best growers, and especial those who have the Eureka, find profitable generally to keep an op tree, not too low, into which the su can penetrate and which will produ fruit both inside and out. Indee many claim that the best grades lemons are produced on the insi of the tree. Such a tree will r need to be "shorn" when it is pru and will shade itself sufficiently protect its outside fruit from burni by the sun. Some top cutting mu of course, be done, for picking fr the top of an unpruned tree soon comes almost too slow to be pr able. There are groves twelve ye old where the thinning method been properly practiced that picked throughout from six-foot l ders. A part of the method, w properly practiced, is to keep lower limbs cut away so that non the fruit touches the ground.

On heavy soil where it is necess to spade about the trunks, t makes it possible to cultivate mu farther under the trees, and thus duces hand work to a minimu This, and the fact that the lin have been thinned and the fran work branches properly trai makes it possible for the pickers see fruit that has come to size, remove it quickly and convenien The bearing surface is large, though some of it is out of re from the ground, it all receives s shine and a free circulation of

Experts who are working on these things with special reference to brown rot and gum disease, report that the trees do not need to be pruned up as in the old method. It is merely necessary that the lowest limbs should clear the ground well when heaviest with fruit and thus admit a good circulation of air, summer cultivation directly to the trunks and, in the winter, a good growth of cover crop well under the outside branches as a protection against brown rot. The damage being done annually by these diseases shows them to be of no small importance, and every detail of pruning or other practice, which will tend to alleviate either, must be sought after and applied.

A Double Decker.

It is, of course, important to produce as much fruit as possible from each acre of land occupied. Now, it is evident from dear experience that when a tree's growth is entirely forced out laterally, it must be placed at a greater distance from its neighbor, if any considerable bearing surface is to be obtained. On the other hand, if some of this bearing surface is put into another "deck" it is at once enlarged without loss of room, and it is only necessary to keep this sufficiently open to produce fruit both inside and out, thus giving vent to the natural growth without excess and at the same time getting the greatest possible fruit bearing wood by proper thinning and cutting back to a certain height. Many growers have planted their trees within twenty feet, or on the quincunx or septuple systems, expecting later to take a portion of them out, and some of these have learned that it is not profitable to do so, for where there is a proper height to the trees this brings about greater per acre production than to allow more space per tree and attempt too much lateral expansion.

A Re-action.

The Baronio system, whose principle is slow, steady circulation, avoidance of a "rush of sap," and elaboration of food materials by branching and lateral extension of limbs, has been practiced with considerable success for a number of years, or while the majority of groves in California were in their younger stages, for they have all practically grown up together. Its success with these growing trees is natural, since it is famous as a scheme to hasten bearing and delay wood growth. The cause of the present reaction, or rather extreme modification of this system seems to be manifold. Primarily, there is a desire to save acreage as much as possible. Most striking, however, is the apparent incongruity between the extremes which have become common and the actual demands of the trees. With this scheme, as with all others, it is necessary to keep out water shoots or suckers and throw the strength of the tree into fruit. But the trees are now stimulated abundantly with fertilizers, (and especially with stable manures and cover crops, which increase, vegetative growth) and with cultivation and irrigation, and the result is that there is a perpetual contest between the tree and its pruner. He is not willing to allow enough top to properly balance the root system, and no amount of coaxing can compel it to consistently make up for a deficiency in vegetative growth with fruit. This is one of the last efforts of a reproductive nature, and is much more likely to occur where the roots themselves are injured, as is often seen in the enormous fruit production of gophered trees.

With pruning, as with other problems, the extremes are the result of the working out of a theory, and it is

ORANGES AT MODESTO.
Where they ripen fruit for early holiday shipment.

Now is the time to go for gophers with

Bille's Gopher Poison

The Gophers go for it and it will go for them good and plenty every time

This is a photo of 201 killed in one day on a ten-acre field before they could get back to their holes, with one bottle of BILLE'S GOPHER POISON.

Endorsed by Agricultural Colleges and Experiment Stations. Has had greatest success for years in the Middle West, and also here in California last season. It is most attractive to gophers, squirrels, etc, and sure death to them. One among many, Amos. L. Grigsby, Campo, Cal., writes: "I have given it a good test, have used all of the two bottles and have almost exterminated the gophers in my 22-acre tract of alfalfa. You know how thick they can get in alfalfa that is not irrigated. Enclosed find $2.50. Send me two more bottles." If your dealer hasn't it, send $2.50 for 2 bottles (not less than two) express prepaid by us. The ingredients can't be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. Anyway send for circular with affidavit of above killing and a few of many testimonials. Compounded Under Bille's Patent by

West Coast Stock Food Co. 818 San Fernando St. (through to Alameda) Los Angeles, California

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Curl Leaf.

Please tell me through the Cultivafor the best spray for curl leaf on peach trees; give formula, method of mixing and time for applying and oblige.—A Subscriber.

Apply the Bordeaux spray before the leaves appear or buds swell. The 5-5-50 formula is usual, and for the benefit of those who do not understand it, it will be given more fully later. It has been given several times during the past year.

Pruning Grapes.

Kindly inform me regarding pruning of Mission, four years old. Also Mataro and Zinfandel. When is the best time to prune for fruit—early or late? What kind of grape would you recommend to plant in adobe land two and one-half miles from Santa Rosa?—Subscriber, Santa Rosa.

These varieties are short pruners and should have about five or six branches which should be pruned back to two buds each; that is, the new wood should be so pruned.

See the leading article on deciduous page of last issue. The last point will be answered by Mr. Mills later.

Bordeaux on Grapes.

Will Bordeaux mixture injure grape vines after they have budded out?—F. C., Lodi.

It will not provided enough lime is added so that it will not show a copper deposit on a polished knife blade after it has been held in the mixture for a few minutes.

Manzanillo Olives.

Can you tell me where I can purchase Manzanillo olive trees?—W. Weitekamp, San Diego.

Any of the nurserymen who advertise in the Cultivator, can furnish you with Manzanillo olive trees.

Potato Fertilizers.

Can I plant potatoes in soil that has been manured lately? I intend to use sugar lime very soon. This land is an orange orchard budded over. The buds are two years old. I intend to put a few rows of potatoes between the trees. The soil is good. How soon can I plant them and what kind would you recommend?—John Koch, Monrovia.

I see no objection to planting potatoes in freshly manured ground. If the lime was spread over the ground and the whole thing ploughed under, the lime would greatly aid in decomposing the manure and rendering it available for the potato crop.

If this has been an old orange grove—that is, if the trees were of considerable size before budding over—care must be had not to attempt to grow too many rows of potatoes between each row of trees. It will result in the trees robbing the potatoes.

The White Rose is an excellent potato and while not of quite as good quality as the Early Rose it is a very handsome potato and sells well. It yields better than most varieties.

Plant any time now—the sooner the better. There will be little likelihood of danger from frost, and it is a good advantage to have the benefit of the rains.—Q. A. L.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Onions.

What variety of onions would you recommend as best adapted for field culture in this locality. Would you advise planting seeds or sets? Do onions require as frequent irrigating as potatoes? What treatment is necessary to prevent them from going to seed?—W. G. G., Hemet.

The Australian Brown is perhaps the best onion to grow. It is a fine keeper and popular with the dealer.

We would prefer to plant the seed. They should be planted any time now that it can be done. This gives the good growing months of spring for making crop.

The only rule that can be given for irrigation is that it shall be frequent enough to keep the plants in constant, active growth. At no time allow the ground to get so dry as to check the growth. It will be evident that the character of the soil, the frequency of showers and the thoroughness of cultivation will enter into the problem and be important factors in determining how often to irrigate.

If the seed is of high quality—that is, produced from perfect, well ripened bulbs, and the cultivation such as should be given, there is little danger of them going to seed. On the other hand, if the seed is poor in quality I know of nothing to prevent them from runing to seed, at least a very large percentage of them. Beware of cheap onion seed. Good onion seed is always expensive—there is no short cut method of producing it.—Q. A. L.

Strawberry Planting.

Will you be kind enough to advise me regarding a proper method for the planting of strawberries. I am about to set out 5000 plants and find, in making inquiries about the necessary preparation of the ground, that there is considerable diversity of opinion as to whether to plant flat or to hill up and how much of a hill to make. Also I propose to plant in single rows three feet apart, the plants to be set one foot apart in the rows; this to avoid hard work.—J. O. VanBrakle, Lindsay,

This query with others will be answered by Mr. Lobingier in the Garden Department of next week's Cultivator.

PREPARING SKINS FOR MARKET.

The following directions for pulling wool from sheepskins and pickling skins for the market were some time ago given by a practical tanner in Hide and Leather: Soak skins and flesh clean. Make up a paint as follows: Slake 25 pounds of lime and use just enough water to cover it. Dissolve 25 pounds of sulphide of soda in 10 gallons of water. Mix the lime and sulphide solution together and paint the flesh side of skins and fold the skins together, flesh in. Lay in a cool place for 24 to 36 hours, when the wool can easily be pulled and washed in clean cold water. The skins are washed to remove the sulphide paint and then placed in a weak lime for two days. They are then washed again and bathed in a bran bath and pickled as follows: For each dozen skins use three-quarters pound of sulphuric acid, eight pounds of salt, 10 gallons of water; leave skins in pickle 12 hours. They are then piled down in smooth piles for 48 hours, when they will be ready for market.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

Wood Sole Boots and Shoes
We wish to call your attention to the fact that we have a large stock of Wood Sole Boots and Shoes of the very best quality. The Uppers are made of the very best quality Milwaukee Oil Grain. The Soles are well-shaped, and are an exact and comfortable fit, and our *Patented Fastening* makes this a *Waterproof* Shoe. We all know wood is a non-conductor, consequently it is much drier and a great deal *warmer* in Winter. They are lighter than Rubber or Leather Shoes and Boots. Shoes, $2.00; Boots, $3.25.

THE GREATEST OF CO-OPERATIVE MARKETING ASSOCIATIONS.

Continued from Page 163.

inspection at the pleasure of the members. These broad principles of full co-operation constitute the basis of the Exchange movement.

The Exchange system is simple, but quite democratic. The local association consists of a number of growers contiguously situated, who unite themselves for the purpose of preparing their fruit for market on a co-operative basis. They establish their own brands, make such rules as they may agree upon for grading, packing and pooling their fruit. Usually these associations own thoroughly equipped packing houses.

All members are given a like privilege to pick and deliver fruit to the packing house, where it is weighed in and properly receipted for. Every grower's fruit is separated into different grades, according to quality, and usually thereafter it goes into the common pool, and in due course takes its percentage of the returns according to grade.

Any given brand is the exclusive property of the Association using it, and the fruit under this brand is always packed in the same locality, and therefore of uniform quality. This is of great advantage in marketing, as the trade soon learns that the pack is reliable.

There are more than eighty associations, covering every citrus fruit district in California, and packing nearly two hundred reliable and guaranteed brands of oranges and lemons.

The several associations in a locality unite to form the local Exchange, which serves as a medium, and to a certain extent as a buffer between the associations and the general Exchange.

Questions of purely local interest, and many real or supposed grievances are disposed of in the local Exchange, and through it more important matters reach the general Exchange.

The California Fruit Growers Exchange, referred to above as the General Exchange, consists of thirteen stockholders, all directors, and all selected by the local Exchanges. In other words, the several local Exchanges designate one man each from their membership as their representative, and he is elected a director of the California Fruit Growers Exchange. By this method the policy-making and governing power of the organization remains in the hands of the local Exchanges.

From top to bottom the organization is planned, dominated and in general detail controlled absolutely by fruit growers, and for the common good of all members. No corporation nor individual reaps from it either dividends or private gain.

This organization has not only been profitable to its members, but has saved the greatest fruit industry of the State.

A movement is on foot all over the northwest to use elevators instead of sacks in handling grain. Some growers maintain that the highest success will never come to the industry until that economy is practiced.

Seventy-five thousand bales of hops were shipped from Oregon, from September 1st. to December 31st. The greatest amount being in the month of December, which was 30,000 bales.

Citrus Fruits in the North

Written especially for the California Cultivator.
BY JOHN ISAAC, SACRAMENTO.

John Isaac is secretary of the State Horticultural Commission and is a regular contributor to the Cultivator. He s known to many also through his aiding in the work of the State Fruit Growers' Conventions for years. Mr. Isaac has had several important missions to other sections in making special investigations of the orange maggot in Mexican orange groves. He gives below a view of Northern citrus conditions.

ORANGES have been grown over a very large part of Northern California from a period very soon after the American occupation, and a tree is still shown at Bidwell's Bar, in Butte county, which it is claimed is the pioneer of the citrus industry in this portion of the State. This tree was grown from a seed from an Acapulco orange in Sacramento in 1855, but was transplanted to its present site in 1859. This demonstration that oranges would grow in Northern California led to other plantings, but these were more for curiosity or for ornamental purposes than anything else, and it was never dreamed that citrus fruits could be grown profitably until many years after.

A PRICELY CITRUS GRO

Every County in State.

The building up of the enormous citrus industry of Southern California, however, turned the attention of the Northern fruit growers in the same direction, and the door-yard trees scattered all over the state served to demonstrate that with proper attention the orange and lemon would thrive very far north of the Tehachepi range, and we know now that there is not a county in the State, outside of the mountain sections, where these fruits will not grow with more or less success in some portion. Every county in the San Joaquin and Sacramento valleys, from Kern to Shasta, produces some oranges, and the same is true of all the coast counties up to Mendocino. Not in all of them is this fruit grown commercially, although very many are now shipping fruit to market and several of the Northern citrus fruit sections have grown into great prominence in the past decade. Not all of the land in the valleys named is suitable for the culture of citrus fruits, but there is still a vast area of land in California upon which oranges and lemons can be produced and which is now used for other crops or for pasturage. The principal sections now planted to citrus fruits are located in the foothills of the Sierra Nevada mountains. Here the soil is largely a loose, gravelly loam, well drained and high enough above the floor of the valleys to escape damaging frosts.

Tulare County.

The principal orange producing sections north of the Tehachepi are Porterville, and its surrounding sections, Lindsay, Exeter, Lime Kiln, Orosi, and other towns, all of which are in the same section. The growth of the industry in this part of the State has been almost phenomenal. It took a start some ten years ago, when a few orchards which had been planted around the town of Porterville came into bearing. In many places here it is absolutely free from frost, and citrus trees did remarkably well. Soil and conditions were all favorable, and the trees bore early, gave heavy yields and the fruit ripened sufficiently early to place it on sale in the East during the holidays. As a consequence, large prices were obtained, and a strong impetus was given to orange planting. From this, the citrus industry grew and spread until it has now become one of the great industries of Tulare county and several thriving towns have sprung up on what was a wheat field and a stock range, and these are well supported by the new industry The orange area in this part of the State is still spreading and new orchards are being planted each season, while young orchards are coming into bearing annually and adding their output to the thousands of cars of citrus fruits being sent from California to the Eastern markets.

In Butte.

Next to Tulare county in importance as an orange producer comes Butte county, and here, around the city of Oroville, and in the sections of Palermo and Thermalito, there are very extensive plantings of citrus fruits and heavy shipments are made. Like the Porterville region, this is a favored location, being well above the ey floor and getting up toward the hills of the Sierra Madre range. fruit produced is of excellent ity, good size and begins to ripen October, so that the growers have advantage of the early market.

lacer county produces a great deal citrus fruit and markets a heavy each year. There is no well de- d citrus section here, but numerous ge groves are scattered through foothills. The earliest shipments ruit were made from this county past season, and the greater part he crop was sold for shipment to tralia.

acramento county has two impor- orange growing districts, Orange- and Oak Grove, both thrifty little ns supported largely by their citrus lucts. In all the counties of San quin and Sacramento valleys there scattering orchards of oranges and ns all adding their quota to the s output of the State, but the e are the chief sections devoted growing oranges commercially. ugh has been done along this line, ever, to demonstrate that should market ever demand the fruit, e are tens of thousands of acres his part of the State which can be oted to citrus fruits.

TRAL CALIFORNIA.

't Understand.

is a matter which no Eastern per- and many of our Californians, understand that oranges can be vn so far north as Shasta county, veen six and seven hundred miles h of Los Angeles and in the lati- of Ohio Pennsylvania and New ey In the East there is a con- ll lowering in the tables of tem- ature for every mile from south to h California, over its whole gth has practically the same cli- e, modified, it is true, by local con- ons and the temperature in this e is rather modified by altitude n by latitude. It is this fact that es possible the cultivation of citrus ts over so wide a range from south orth Another matter which is d- lt to understand is the fact that us fruits ripen and are marketed ier in the North than in the South. e can be accounted for by the to- raphy of the two sections. In the thern orange sections the whole ntry is open to the Pacific Ocean, even in the most remote sections temperature is modified by the an winds. There is nearly always ery much lower degree of heat ing the nights than during the s. In the interior valleys the influ- e of the ocean winds is shut off by intervening Coast Range of moun- s and the nights are much warmer n those of the South. As a result fruit grows more rapidly, receiving checks from cold nights, and ma- es and ripens earlier than that of South.

Not Competitors.

There is very little prospect that the northern counties will ever become serious competitors with the south, for in the latter section citrus culture has become a science and is so firmly established that it need fear no disturbance, but for all that, the growth of the citrus industry has been, and still is, making rapid strides. it has been only during the past decade that it has attracted attention. Prior to that time the production of oranges in the north on a commercial scale, was a standing joke with many of the papers of the south, and the proposition of growing oranges north of the Tehachepi was regarded with incredulity by many of the leading growers of the south. But the success along this line made by Tulare county and on a lesser scale by Butte county has demonstrated what can be done along this line, and every season sees larger and larger outputs of citrus fruits from the north. The first shipments, of course, were trifling, amounting to a few cars only. These soon expanded to a hundred, then several hundred, until three years ago the output from the north was in round numbers 2000 cars. In the next shipping season this had reached nearly 3000 cars, and last season the figures nearly touched the 4000 mark. It is now estimated that the present season's output will come close to 6000 carloads, and these figures will increase as the new orchards which have been planted during the past five years, come into bearing and the older ones reach their full bearing capacity.

There is one great advantage that the northern citrus grower has and that is in the early ripening of his fruit. The great bulk of the crop in this section is off the trees and marketed before the holidays and it catches the holiday trade, bringing very much higher prices than that which comes in later. Another great advantage, possessed by the northern grower, is that his fruit is all off the trees before any extreme cold weather comes, and loss from frost is unknown. for in the north, as in the south, there are always chances of freezes from December to March.

All Over This State.

There is no question but that, if the markets will warrant it, the orange area of the northern counties will be largely extended, and even at the present time, there is a steady growth, and there is a vast area of land suitable for citrus fruits as yet untouched in this State. It may be safely stated that the entire foothill range of the Sierra Nevada mountains, from Kern to Shasta, is suitable for citrus fruits. This, of course, with the understanding that water is available for irrigation, and that there are numerous locations where the soil is unsuitable. Aside from this, however, the orange can be profitably grown over the larger part of the whole State.

Nursery Business For Sale

Fine Opening for the Right Party

Owing to poor health in the family, I will sell at a sacrifice my prosperous nursery business in Whittier, which I established and have carried on successfully for 20 years.

I will sell business and stock, with or without land.

I have a fine line of grafted walnut trees. Several still on hand, and a nice lot to graft for next year. Also 7000 or 8000 orange trees for next year's market.

Will be pleased to have interested parties investigate.

Whittier Nursery, Whittier, Cal.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Eastern Citrus Markets; Citrus Shipments; Local Conditions, 182, 183.

CALIFORNIA'S CITRUS SECTIONS.

The wonder of the Easterner is created by the fact that sections in California nearer the North Pole than is Indianapolis, Columbus, Philadelphia or Washington are successfully growing oranges and lemons. And again that all the way down the State to the Mexican border, over 600 miles from north to south, almost the same condition prevails, until the enormous total of 30,000 cars, or nearly 2000 trains, six trains per day the year through, of the golden fruit are spared from our own consumption and shipped to the orange lovers of the East.

From this vast output of California's pride the East sent of its good coin last year between $25,000,000 and $30,000,000. These figures are almost too vast to grasp and effectually dispel the charge often made by our critics that our only asset is climate and the "easy-mark" tourist.

California is daily showing its actual production to be increasing and this power will continue to increase each year.

With the shifting of the center of this country a little this side of the Adirondacks to this Coast and with the whole United States facing westward, the country is taking notice of the importance of this section and that it is a great factor in the productions of the United States.

The greatest of our fruit productions is the citrus. The possibilities of its future development are not fully appreciated. While as yet the section south of Tehachepi is the great factor, there are possibilities hundreds of miles to the north. Butte county has hundreds of acres planted and for several years has been sending out fine fruit. This year much of her fruit went to Australia.

Sacramento and other near-by counties have done but little shipping as yet, but some sections will later be heard from. Fresno and other counties near are only beginning to develop their latent possibilities along this same line.

Tulare sent this year over 2500 carloads, and is the strongest commercial factor in this industry north of Tehachepi.

Southern California comes in with its enormous total of nearly 28,000 carloads. The field which produced that fruit is daily becoming larger. For instance, within the last year the great Imperial and Coachella valleys have promised the earliest oranges in the world, as they are now producing the earliest cantaloupes.

On the other hand, some sections very close to the ocean which were once thought to be so much affected by ocean influences have shown a great producing power, especially with lemons and the Valencia orange. From Santa Barbara to San Diego some of the finest oranges and late lemons shipped out of this State have been produced. These oranges, ripening the latest of any, extend the season until shipments of oranges are made every day in the year.

The orange and lemon are native of the foothill regions of India and are found in their wild state at an elevation of 4000 feet. Yet their cultivation for centuries upon the islands and along the shores of the Mediterranean has undoubtedly changed their nature and adapted them to conditions different from the lands where they originated.

The oranges from the ancient port of Jaffa were at one time thought to be the finest oranges in the world. They were grown largely near the coast. The lemons of Genoa, Mentone and Nice are exceptionally fine, yet are grown near the sea in a latitude of 44 north.

So it would appear that in the future we may look to see our foothill lands near the sea, planted to citrus fruits, which will vie in quality and quantity, with the more remote sections of the State.

GREATEST FRUIT GROWERS' CONVENTION.

The next State Fruit Growers' Convention, which is to be held in Riverside, is bound to be a great event in the fruit growing history of this State. In the first place, the efficient work of Commissioner Jeffrey and Secretary Isaac, is to be supplemented by a strong working local committee at Riverside, of which the old veteran J. H. Reed, is the head. Mr. Reed has said: "It is my ambition to help make this the largest and most important gathering of fruit growers ever held on the Pacific Coast. The mark is set at not less than 500 delegates from all parts of the State. Outside of an attractive program, continuous hard work of our local committee will be given to make it a sucess."

Riverside is an ideal convention city. It is progressive and up-to-date. It will be an education to fruit growers to go there. Let plans be made now that nothing shall interfere with attendance at this thirty-fourth State Fruit Growers' Convention.

It will be held about the first of May.

GREATER THAN OUR GOLD.

The California Board of Trade sends out a statement which most people will be surprised to read; it is that the average yearly product of the soil of the State amounts to $261,000,000, while our mineral wealth is but $135,000,000. In the latter estimate the product of coal and cement, lumber and other forest outputs are embraced.

Last year we shipped, according to this statement, 27,487 carloads of citrus fruits worth about $34,000,000. This is twice the output of gold mined in the State and a living proof that the wealth of the California lies in her cultural crops rather than in her buried treasure. We wonder how long it will take people to find this out?

HORTICULTURAL QUARANTINE SERVI

The horticultural quarantine service at Francisco seems to be having its hands full tl times inspecting and destroying diseased fı vegetables and trees. Edward M. Erhorn, deı horticultural commissioner, stated to the edito the Rural Press, recently, that the commissior stroyed 13½ per cent more shipments receive San Francisco in 1907 than in 1906. This, tc exact, and to quote Mr. Erhorn, "was due to finding of a new pest in the apple shipments f the Puget Sound country, a new disease in oni and the condemnation of all Japanese orange fested with cladosporium citri—a fungus w causes ugly blemishes on the skin. One shipn of 6005 boxes of apples from Bellingham, Wa was shipped back, and in one instance 2424 bc of Japanese oranges were carried out to sea dumped. A number of other shipments had tc destroyed for one cause or another. The re shows that during 1907 there were received San Francisco from 250 steamers 61,642 bo crates, packages, etc., of fruit and vegetables 616 of trees and plants; 3458 cases, crates boxes came by rail, and 1180 loose lots were amined. Of the total number 10,329 were stroyed."

If the same degree of vigilance is exercised the said commissioner, and we have no reasoı believe otherwise, there will be far less per c of diseased fruit and trees in California in future than there has been in the past.

The estimates of the United States Depar of Agriculture show that nearly 2 per cent l land was seeded with wheat in the United S the past fall than in the previous fall. The a age condition of the crop, December 1, 1907, reported at 91.1 as compared with 94.1 on Dec ber 1, 1906, and a ten-year average of 93.

Civic societies ought to be at work in ev big and little town in California perfecting pl for beautifying the localities in which they e This is the month to push the campaign for m beautiful surroundings, good roads, etc.

Shop Talk

THE NEW POSTAL RULE.

The Postmaster-General has recently ma new ruling, to go into effect in the near fu and which is aimed to regulate subscriptions all publications.

The Cultivator comes under this rule, of co and must be governed by it to the extent tha affects weekly papers.

The substance of the mater is that such wee papers will not be allowed to go through the n at the usual postal rate if the subscriber is o a year in arrears. The measure has caused c siderable comment, both favorable and unfa able, from publishers, but we notice that the tent of their criticism is usually regulated b legitimacy of their subscription list.

There is no doubt, however, that the mea will be a protection for every honorable lisher, subscriber and advertiser, and we d to say that the **Cultivator** is in entire s pathy with the order. We contend that a str paid-up circulation of 12,000 is worth as m to an advertiser and publisher as a circula of 50,000 composed of people who never or the paper and in a great many instances ne open it nor look at it.

The **Cultivator** is now practically on cash-in-advance basis and the ruling will not fect our business other than that in future cannot be as lenient to subscribers who are arrears. It is not our desire to work a hards on even these, but it will be necessary for s to pay up as rapidly as possible in order to a inconvenience by way of increased cost or s page of the paper. We shall endeavor in fu to notify our subscribers of the date of exp tion, either by an agent or direct from this o We shall also appreciate close atention to date label on the paper and prompt remitta

To the subscription manager a prompt re tance is an indication of interest in the pa which is very encouraging.

olusa county cotton is being ex- ted in the East, and attracting h attention.

he upper Sacramento Valley has ived a total rainfall ranging from o 15 inches.

number of farmers at Williams e combined to experiment in the ting of sugar beets.

'er one hundred thousand scions Hungarian grapes have been ped from Santa Rosa to one firm 'rance.

he management of the Petaluma ltry show ended its season with .17 in the treasury, which is a l showing.

he California Fish & Game Com- sion have decided to introduce garian partridges and release in a county.

he levees along the Sacramento the city of Sacramento are to be ngthened, the State bearing one- d the expense.

he fruit men near Lincoln are re- ing in the cool weather, wh prevails, as it retards the bud- of the trees.

any California black walnuts hav- been planted along the roads of a valley will be later grafted softshell walnuts.

acramento County Development ociation reports that crops will be er through the valley this season n for many years.

ineyardists near Gridley are mak- arrangements for extensive stak- up of the vineyards hoping to e easily control the mildew.

erkeley dairymen are being given ard run by the Health Board of that putting up to them what they m to be unreasonable require- its.

ecretary Isaacs of the State Com- sion of Horticulture is compiling w edition of the State horticultural s and county horticultural ordi- ces.

he longest period of constant ifall that has occured in the mem- of the oldest inhabitant, is the ort of the recent Sacramento val- storm.

he Klamath irrigation project, ch will aid irrigation in a vast ntity of land in Southern Oregon Northern California, is being aid- by land owners of these sections.

he officials of the Hamilton Beet ar Factory now estimate that they have contracts for over 7000 es of beets. They had hoped to ire the planting of over 10,000 es.

farmer near Anderson is making horough and businesslike experi- nt of farming along the line of the tern farmer, having some orchard the greater part of a 70-acre ch in alfalfa and grain. His in was stored and is just now be- threshed.

Central California

Porterville is to have a forty-acre park.

Tulare total rain to date is 6.06 inches.

Sanger had a fine farmers' institute last week.

Lindsay has shipped about 900 cars of oranges.

Salinas has had 6.71 inches of rain this season.

San Joaquin Valley had an inch rainfall during the recent storm.

County Entomologist Volck is preparing a bulletin on codling moth.

Modesto is now promised a cannery in time for the next season's pack.

The Kearney estate is soon to be transferred to the State University.

The cantaloupe shippers at Turlock are planning for a big season this year.

The Salinas Index is appealing for reservoirs for the saving of the waste water.

The raisin market seems to be very quiet at the present time, and the packers are now offering in the neighborhood of $70 per ton for last season's crop.

So much good material has been supplied the Cultivator for the Special Citrus number, that some of it must of necessity be held over till next week. Mr. James Mills' article will be continued.. Mr. Teagues with additional illustrations will be finished next week and other good citrus matter including a couple of articles on oranges in Butte county and on citrus culture in Tulare county.

An immense number of orange trees is to be planted about Lindsay this spring.

The new Corcoran sugar factory will this year handle beets from about 6000 acres.

Onion growers near Modesto have made stacks of money on their onion crops this season.

It now appears that Visalia will be the place of holding the next Tulare county citrus fair.

Salinas seems to be producing nice new potatoes the year round and is now marketing new spuds

Scandinavian Mutual Fire Insurance Association of Fresno County carries nearly $2,000,000 of insurance.

E. B. Babcock, assistant plant pathologist of the State University, is investigating fungus troubles at Salinas.

Inspector Day, of San Benito county, has condemned a shipment of young peach trees infested with the blight.

Orchards about Watsonville are being leased by apple shippers, who do this to secure their output during the shipping season.

The Tulare county citrus fair, which was held at Lindsay, has now closed up its business and finds a balance on hand of $502.

Dave Sherwood of Elk Grove received $15 for two crates of Tokay grapes shipped last season. This is the banner price of this season.

The Pacific Sugar Company has already contracted for the growth of nearly 9000 acres of sugar beets for next season's delivery. Nearly half of this amount has already been seeded and most of the balance plowed ready for seeding.

Southern California

Ventura has had 10.71 inches of rain.

A tomato grower at San Pasqual is coining money on his tomatoes.

San Jacinto has nearly 8 inches of rain to date.

Chino expects to plant 11,000 acres to sugar beets.

Redlands merchants have organized to fight the parcels post.

Heber is hoping to have an agricultural college established there.

Large plantings of eucalyptus will be made in the Yucaipe valley this year.

Santa Paula is making extensive experiments in the culture of the citron.

A Redlands nurseryman is anticipating starting a spineless cactus nursery.

McIntyre, the bee king of Ventura county, says that bees are busy workers just now.

The forest rangers, while they are having an easy time in watching for fires at this season of the year, are kept busy keeping the trails in repair.

Poultry breeders of Santa Ana are organizing the Orange County Poultry Association.

Cotton growers from Texas are preparing to establish their industry in Imperial valley.

The last meeting of the Southern California Lemon Men's Club was held at Whittier.

The cabbages of the La Habra valley will be handled by the Tustin Packing Company.

The Whittier News says that cabbage growers are now wearing the smile that won't come off.

Coachella valley is being supplied with a large number of lady bugs for work upon the melon aphis.

Holtville farmers are suffering from great losses from thousands of wild ducks making inroads on their fields.

Ventura apricot growers have been among the strongest workers to secure a reversal of the famous sulphur ruling.

Hemet marketed over $20,000 worth of olives last season, and hopes to double that amount for the present season.

Santa Ana irrigationists are taking advantage of the wet weather and are giving their canals and ditches a thorough cleaning.

Orange County Celery Growers' Association has arranged to market their fruit through the California Vegetable Union.

M. B. Molten, of Hemet, is harvesting 10 tons of olives from two acres, for which he is receiving $80 per ton. Mr. Shepard of the same place has received $500 from two and a half acres.

The Coast

Farmers at Weston, Ore., are combining and building grain warehouses.

Zero weather has prevailed at Wenatchee, Washington, during the last few days.

A government Experiment Station is soon to be established at Rosalia, Washington.

A large acreage of winter apples will be planted about Pullman, Washington, this season.

Flour mills at Tacoma, Washington, have closed down because of shortage in foreign dmeand.

At the dry farmers' congress at Salt Lake City Gov. Brooks of Wyoming was elected president.

Cottage Grove, Oregon, is expecting the establishing of a cannery before next season's fruit ripens.

A fruit grower at Coos Bay, Oregon, has found the growing of cramberries exceedingly profitable in that section.

The Dairy Development Association has just been organized at Portland, Ore., to promote more and better dairying.

Pacific Coast hop growers will meet at Pullaup, Wash., for the purpose of perfecting the organization of the Coast hop growers.

The recent poultry show at Seattle, Wash., drew an exhibit of 1000 thoroughbred birds. Plymouth rocks were the largest class.

The recent meeting of the Utah State Horticultural Society is said to have been the best meeting ever held by that organization.

Orchardists around Tulare will increase the fruit tree acreage this spring by planting about 200 acres, largely peaches and apricots.

The State Horticultural Society of Washington is planning for a mammoth apple show at its meeting which will be held in Spokane next January.

The Walla Walla Farmers' Union has contracted for almost a million and a half of wheat sacks for which the agreed price is seven and three-eighths cents.

Oregon onion growers who held their crop until the present are highly gratified at present prices. It is predicted, however, that next year's prices will be vastly lower.

There is a strong demand amongst the sheep men near Baker City, Oregon, that the county shall levy a special tax for bounty on coyotes, wild cats and other wild animals.

The Deseret Farmer appeals for the organization of the fruit growers into a fruit growers' co-operative society so as to rid themselves of the burden of the middlemen fruit dealers.

The Inland Grain Growers' Association near Pendleton, Oregon, are endeavoring to secure a reduction in freight rates which, it is claimed, is almost prohibitive from that section.

A permanent organization of the fruit growers of Freewater and Milton, Oregon, has been effected and the name of the new organization is Milton-Freewater Horticultural Society.

The Wenatchee Valley Fruit Growers' Association at its second annual convention had an attendance of 250 fruit growers. The effort will be made to conduct a campaign for better packing and more care of fruit.

Profit in the Poultry Yar

We solicit short articles of a practical nature from the fancier and utili breeder, giving their experiences with poultry. All inquiries pertaining to fee management, disease and its prevention will be answered through these column

UTILITY AND FANCY COMBINED.

WE WERE recently talking with a man who had recently attended a big poultry show. He said he had attended the show to get information in regard to the different breeds, but all he talked to showed what fine feathers their birds had. Never once did they tell how many eggs the hens would lay or how long from time hatched till they were matured ready for market or ready to lay. Said he did not believe fine show birds were good layers, as their owners never mentioned their laying qualities at all. He wanted to know if they should lay as many eggs as the common barnyard bird.

Here we have an example of one of the many who attend poultry shows for the education which should be possible there, and the exhibitors of the show neglected the opportunity offered them to explain the utility as well as the fancy points of their birds. We believe the fancier should use every opportunity offered to explain the advantages to be gained in breeding thoroughbred fowls over that of the common mongrel.

The argument this gentleman gave for not breeding thoroughbred fowls is one we hear very often. Many have decided opinions and are hard to convince that the backbone of the poultry industry is the fancy.

There is no subject connected with poultry raising that receives so many knocks, as the possibility of combining utility and fancy. Most all can agree as to size and shape; that is, they will admit that a fancy bred bird may have just as good shape and well developed carcas when dressed as the utility man can produce, but they "know" that a fancy bird will not lay as many eggs as the common bred birds

We have had the utility man come to our yards to get a male bird for crossing. He only wanted size, did not care for shape and color, yet they would invariably pick out the best colored and most symmetrical bird as the one they liked best. We only give this as an example to show that the utility man apprecriates shape and color just as well as the fancier. This only leaves two points to be considered—that of egg production and early maturity.

Egg Production and Maturity.

One of the hardest arguments we have to go against is egg production and vigor. Many insist that an ill-bred, common "go-lucky" flock are more vigorous, mature quicker and lay more than thoroughbred birds. Yet in nine cases out of ten, these same men are breeding thoroughbred live stock of some kind and insist that it is better. That is, for everything but poultry. The trouble is with the man that breeds common stock; they never know how many birds they have or how many eggs they get per year. We don't honestly believe that the average mongrel flock will average 125 eggs per year.

We positively know of birds in the American and English classes that were matured and began to lay at from four and one-half to six months of age, and Mediterraneans will begin to lay earlier, if proper care and feed be given them.

We know where egg-laying con have been made at experiment tions, that individual records been made, under State and go ment direction, that the numbe eggs run from 175 to 200 per and this with thoroughbreds. know of individual records higher than these.

If we would combine utility fancy, we should not breed fro bird unless it be from good, str vigorous stock, and from a st that had a good egg record behin

Trap Nest.

The best aid in selecting breeders and helping us to build an egg-producing strain, is to u trap nest. With the trap nest we keep individual records, and if a is not a good layer, although sh a prize winner, we would not ad keeping her simply because she a prize winner.

We know of lots of breeders, of them using our columns to tise stock and eggs, who use nests and have pens of birds records of over 200 eggs each. recentlly read of a first prize w at an Eastern show with a recor 201 eggs in a year. The man wh doing most for the industry is one that is breeding for fancy utility.

We would be pleased to re short reports of individual recor as to what age pullets began to and how many eggs per year, gi variety in each instance.

"STILL AGOIN."

On January 23 we published a munication from Mr. W. F. K., some comments on same. We published a letter from Mr. Hya Petaluma which answered Mr. W K. pretty well from a practical s point. We are glad print here a splendid communication from W. S. Sullivan, Agnew, breede Buff Orpingtons, giving the fan side of the question. Mr. Sul has been breeding thoroughbred twenty years and is "still going"

Mr. Sullivan.

More than some poultrymen money.

Shake, Mr. Hyatt. Your stat in the California Cultivator of ary 28 should make Mr. W. T. Santa Ana "look around a littl should judge from his letter he might be acquainted with son called breeders we have heard of bought a setting of eggs, an old h sack of wheat and expected th to make dollars for them by the they offered "suckers" in th worded advertisements. Now, t cept the matter as W. T. K. pu without answering by someone s birds and eggs at the figures he q many might think that simpl only paid such prices as $1.00 eac eggs and $25.00 and even mor breeding birds. The writer hap to have a few of these same sl tons on his list of pleased custo among them those who have $10.00 and $50.00 for single mens, $15.00 for single settin eggs, and for three and four ye succession.

As an example, Mr. M M Bak Peoria, Ill., saw the birds exh

S. C. White Leghorns

· The Kind
That Pays

For my breeding birds I each year select a number of my handsomest, earliest developing pullets and trap nest them during their entire first laying year. The next season from these I select only those having satisfactory laying records. In my breeding pens are only hens of proven worth in their second and third season, and no bird that has ever shown a trace of disease. Each pen mated eleven hens to one handsome cock. I believe there is not in California a handsomer or better lot of birds and few as good. Can furnish eggs for hatching from these birds at $1.50 for 15, $7.50 per 100 or $60 per 1000. Let me book your order now.
Correspondence solicited.

by the writer at the World's Fair, St. Louis, 1904, and this gentleman is such a simpleton that he is the head of one of the largest agricultural machinery manufactories in the United States. Mr. Baker ordered eggs for hatching from our best matings—that year sold at $10.00, the next year again at $1.00 per egg—the results very satisfactory, and in November last I shipped him a cock bird that won first at San Jose show, second at Los Angeles, January, '07, second at State Fair, Sacramento, '07. This same bird won first at Peoria last week. With his first cockerel hatched from an egg that was packed and shipped when warm from the nest, laid by "Mayflower," the fourth pullet at World's Fair, '04, and marked on the shell what it was. Mr. Baker wrote this was the first egg to hatch, and again orders eggs of our very best for March, '08, at $1.00 each.

There is a reason for getting these prices—birds, line, breed—that have the quality and show it in the offspring. They have a value as breeders just as much as do horses, cattle and other live stock.

Simpletons don't part with money for chickens such as these; they know too much. Perhaps Mr. W. T. K. does not know that the highest prices are paid by those in the same line and not by the foolish or those unacquainted with the real worth of the exceptional specimens. Let Mr. W. T. K. look up the Reliable Poultry Journal of a year and a half ago and he will find he is away short in figures. Seventeen R. C. B. Minorcas sold for $3,400.00, and $1000 refused for another from the same yards.

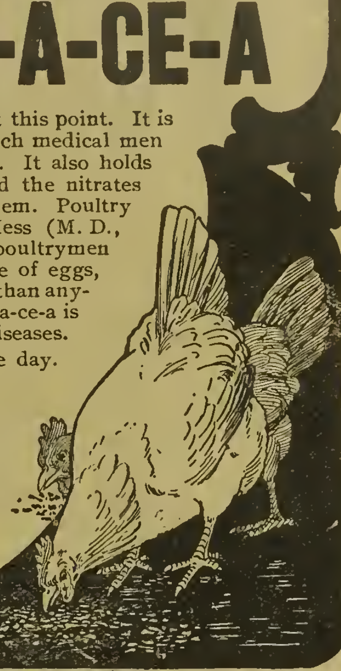
Simpletons sometimes write to "the papers." I expect to buy one-half of Los Angeles with my check for this letter to the editor. I believe I have been paid as much as $2.00 once for a short article in an eastern farm paper and I was almost sick when I received the check and had to look at it a long time before I realized I was of so much importance as to be paid for a little chicken talk. I have, however, written thousands of words for different publications for the pure love of it, and the good I thought it might perhaps do some one who was a beginner.

There is money in poultry; as a market proposition we all well know it pays; the rearing of exhibition stock is another branch that pays, and pays well if you can "deliver the goods," but to be charitable, probably Mr. W. T. K. is not familiar with "the game." Study up; get some good stock, Mr. Man. "Play fair" and you will find you deal with the best people on earth—lovers of good fowls.

W. S. SULLIVAN, "at it twenty years and still goin'."

FIVE ACRES OF WHITE LEGHORNS.

One of the most complete poultry ranches in Southern California is to be found at 126 South Adams street, Riverside. This plant is owned by Mr. S. E. Gregg, and is devoted entirely to White Leghorns. Mr. Gregg is a thorough, consistent breeder, and by hard work and careful attention, has built up one of the best flocks of White Leghorns in the State. When we visited Mr. Gregg's ranch we found one of the nicest, cleanest flocks of Leghorns that we have seen for a long time. This flock is not bred altogether for fancy points, but for utility as well. As only birds that have made a creditable showing in the production of eggs are considered as worthy to go into a breeding pen. Those in need of good, strong, vigorous stock should correspond with Mr. Gregg.



Feed Rather Than Breed

There is more in the proper management of a hen than in the hen herself—feed and care count for more than "blood." Some breeds lay better than others, but a man who don't "know how" will spoil the *best* hen; while a man of experience will get eggs from the hen who hasn't a disposition to lay. The secret lies in giving the hen *perfect digestion*, because if she does not extract from her food the elements of the egg, she is sure to be non-productive.

DR. HESS
Poultry PAN-A-CE-A

fully meets the needs of the poultryman at this point. It is a tonic containing the bitter principles which medical men tell us will assist and strengthen digestion. It also holds salts of iron, which makes good blood and the nitrates which expel poisonous matter from the system. Poultry Pan-a-ce-a is the prescription of Dr. Hess (M. D., D. V. S.) and is endorsed by leading poultrymen everywhere. It makes hens lay abundance of eggs, forces chicks to early maturity and is better than anything else to help fatten market birds. Pan-a-ce-a is also a germicide and wards off poultry diseases.

Costs but a penny to feed 30 fowls one day.
Sold on a written guarantee.

Starbuck's Barred Plymouth Rocks
We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are layingfine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) We have something to crow about. No Sunday sales or visitors. Orders postmarked after Feb. 12th will be charged $2.50.

INCUBATORS vs. HENS.

When you want early chicks how can you induce the hens to become brooody? Maybe someone knows the secret. We do not. But we do not need to know it. The question of fertile eggs being settled, it is easy to get a substitute for the broody hen. Incubators will do the work at any season. They never leave their job and chill the eggs, they never get on the wrong nest, they never get cranky and break the eggs.

It is the early chick that pays. It gets a good growth before the vermin of summer come to sap it of vitality. You don't see the early chick moping around covered with lice and with no ambition to get rid of them. The early chick is fit for market at a time when prices are good. If kept for laying she begins business in the fall when eggs are worth good money.

After you have the incubator paid for it is of no expense worth mentioning to keep running. It will last a lifetime without expensive repairs, if well cared for. It eats no grain while doing nothing. How about the hen? She is an expense at all times. The only way to keep her from running you in debt is to make her lay eggs nearly all the year instead of sitting or mothering chicks. Get posted on incubators in time to by early. Write for catadogues now.

THE LAY OF A HEN,

There was a hen that had a lay,
  Which lay she sang, and sang each
    day;
But not an egg this hen did lay.
Although this lay she sang each day!
  And now this hen and lay are laid
Where all such hens and lays should
    lay;
  And in their stead a biddy staid,
Does sing her lay, and lays each day
    an egg.—Western Garden.

The newly elected officers of the Oregon State Poultry Association who will serve for the coming year are: President, J. C. Murray, of Portland; vice-president, D. N. Lash; secretary J. E. Windle, of Lents; treasurer, W. P. Snook, of Portland.

PHEASANT FARMING.

The Cultivator is in receipt of a pamphlet on pheasant farming written by Gene M. Simpson of Corvallis, Oregon. It contains general information about pheasants with instructions ho to raise them.

The breeding of pheasants must be a pleasant occupation, and, no doubt, the little booklet will create interest in it. Mr. Simpson will be glad to get in touch with any interested in phea ants.

BUFF LEGHORN SPECIALISTS.

Lindgren Bros., Kingsbury, Cal are perhaps the best known and mo extensive Buff Leghorn breeders California They have been breedi this variety for 16 years and have exhibited from New York to San Fran cisco, always winning in the stronge competition. They know the true Leghorn type and have the soft, eve shade of color that is so hard to breed. Anyone interested in this breed shoul write them for particulars; they hav the goods.

Oil having been discovered in paying quantities adjoining the Wm Niles ranch, he has concluded to reduce his stock at the lowest possibl prices. See his card in our stock advertising columns.

Hollingworth, Santa Cruz, wh starts an advertisement in this issue is an old breeder, having bred and exhibited poultry in England. Mr Hollingworth is not only an exhibitor but a winner at the late Oaklan show; he won eight firsts in stron competition. Those in need of stock or eggs will receive fair treatment from Mr. Hollingworth

ARE ROADSIDE TREES A DRAIN ON ORCHARDS.

Continued from Page 162.

of the pepper, eucalyptus and most of the shade trees used on our streets run near the surface, and a trench along the property line 25 or 30 inches deep severs most of the damaging roots, without materially injuring the tree. This trenching, done when the ground is soft, is inexpensive, and is much used here. The efficiency of this root cutting I recently found markedly demonstrated at Rialto, where many of the orchards are protected from heavy winds, sometimes experienced there, by thickly set, large eucalyptus and cypress wind-breaks. A heavy, steel cutting blade four or five feet long, eight inches wide, one inch thick, is attached to the front running gear of a wagon. This is drawn by ten horses and cuts all roots. This machine is owned, and if I remember rightly, devised and part of it patented by a livery stable man, who does the work for the orchardists, charging ten dollars for cutting across two sides of a ten-acre orchard. Other lighter implements drawn by four or six horses are also used there, owned by the farmers. These, too, have been run several times in a place. But they certainly have practically solved the problem of street tree root damage to orchards. I found the outside rows of their splendid orange orchards, under these great windbreaks, apparently as vigorous and well fruited as those farther in.

Here in Riverside, as fast as practicable, we are relieving the adjoining orange orchards and alfalfa fields by thinning out the too thickly planted street trees. Where present varieties are undesirable, we interplant to what will make a more permanent tree with view of removing the old trees after the new plantings are large enough to make a showing.

Plant for the Future.

In all this street tree management we must remember it should be done with a view of their serving several generations to follow us, and not alone for our present satisfaction.

Stephen Girard once said: "If I knew I would die tomorrow, nevertheless I would plant a tree today."

HE COULD COUNT.

A very little boy was in the room where a young lady was practicing on the piano. She was counting aloud, "One, two, three, four." The little fellow, quite surprised, after a while went to her and said earnestly, "Ee next is five!"—The Youth's Companion.

Gunner—"So the celebrated poet married Miss Penner, the short story writer?"

Guyer—"Yes, and some of their wedding presents were cruel insinuations."

Gnnner—"What did they receive?"

Guyer—"Sixteen waste baskets embellished with ribbons."—Chicago Daily News.

Pa Twaddles—"Tommy, I am not at all pleased with the report your mother gives me of your conduct today."

Tommy Twaddles—"I knowed you wouldn't be, an' I told her so. But she went right ahead and made the report. Jest like a woman, ain't it."—Cleveland Leader.

Mr. Meane—"I have nothing but praise for the new minister."

Mr. Goods—"So I noticed when the plate came around."—Philadelphia Inquirer.

CITRUS CULTURE IN CALIFORNIA.

Continued from Page 155.

We found by practice that if the trees are taken from the nursery balled and stacked under a partial shade as is afforded by a lath house or a tree with dense foliage for five or six days and kept moist enough to prevent wilting, they will transplant in excellent shape. If the trees are slightly wilted when placed in the holes and irrigated immediately they will take up the water faster than if they are put in soaking wet. Care should be taken not to allow the fibrous roots to become dry, for then the trees will be badly injured, if not killed.

Mr. Reed's directions after planting are as follows: A small amount of fertilizer is applied soon after planting for the young roots to use when they first start out of the balls. A pure bat guano with a big per centage of nitrogen, about three-fourths of a pound to the tree, has been found to give the best rsults, but any commercial fertilizer rich in nitrogen or animal fertilizer, if placed properly and kept moist, answers well. It is applied in trenches each side of the ball, at right angles with the irrigation furrows and reaching to them. They may be made by a deep furrow and deepened with a shovel to about one foot. The material is carefully distributed and slightly mixed with earth at the bottom of the furrows, the water from the irrigation furrows keeping this always moist, it is available as soon as reached by the rootlets. This also tends to deep rooting. Thorough irrigation should follow planting every twelve or fifteen days through the summer. The whole space between the rows should be deeply and thoroughly wet—not merely a narrow strip on each side of the rows. I have traced roots that have grown during the first summer over six feet from the trees, and these should be well supplied with moisture at all times.

The advantage claimed by Mr. Reed is, that the tops of the trees are retained and they made use of immediately. The large leaf surface is brought into use at once, which means that instead of the reserve force of the tree being drawn upon to start a new set of leaves and branches, the leaves retained enter at once into elaborating the sap and building up the tree.

Orange trees planted after the Reed system have tops that are from twice to four times as large as when they start their new growth, as are those of trees planted the usual way after they are six months old. Trees planted after this system have produced ten boxes per acre the second year, and three hundred boxes in the third year.

Trees planted in midsummer in the above-described manner, will stand the cold better than an early planted tree that has been severely cut back before transplanting.

Mr. Mills will continue this article in future Cultivator.

The officers of the Washington State Horticultural Society are as follows: President, H. M. Gilbert, North Yakima; first vice-president, H. W. Crowell, Spokane; second vice-president, H. Horns, Wenatchee; treasurer, William Ritz, Walla Walla; secretary, Levi G. Monroe, Spokane.

NEW 1908
DE LAVAL
CREAM
SEPARATORS

1908 marks another great move forward in the development of the Cream Separator—the introduction of a complete new line of DE LAVAL Farm and Dairy Sizes of machines, ranging in separating capacity from 135 lbs. to 1350 lbs. of milk per hour.

As nearly perfect as the DE LAVAL machines have been before, they are now still further improved in practically every detail of construction and efficiency, and every feature reflects the past two years of experiment and test by the De Laval engineers and experts throughout the world.

The principal changes are in greater simplicity of construction, ease of cleaning and replacement of parts; less cost of repairs when necessary; easier hand operation; more complete separation under hard conditions; greater capacity, and a material reduction of prices in proportion to capacity.

The DE LAVAL was the original Cream Separator and for thirty years it has led in making every new separator invention and improvement. Every good feature is now bettered and retained and many new and novel ones added, rendering DE LAVAL superiority over imitating machines even greater in every way than ever before.

A new 1908 DE LAVAL catalogue and any desired particulars are to be had for the asking.

SANITARY MILK.

THE stable, the cow, the milker and everything about milk must be of sanitary cleanliness, if a perfect milk is produced. The cow we own, the stable we own, to keep these clean is only a matter of expenditure and supervision. The milker we do not own; he is the most independent man we employ. Today he is with us, tomorrow he flits, often like the bats going at night. How can we keep him clean? The difficulty is often to procure any milker, yet morning and evening, and perhaps at noon time, the cows must be milked. The dairyman is handicapped by the fact of time; cows are on time always with their full udders. The dairyman has often to close his eyes to the fact that all is not perfect at the dairy barn. It is necessary to be diplomatic to induce the milker to put on clean clothes at milking time. Then to wash his hands and clean his finger nails. Why? If he is not naturally so disposed to do these things, be sure you have another man waiting before insisting. Yet we are all alike, for was any one ever willing to admit they are not clean?

Inspectors.

The dairyman could be helped instead of hindered by the authorities. The milkers have got the cinch on him. I have known of a dairyman struggling to make the milker clean up and keep clean, finally discharging the slovenly fellow. Before the new milker got to know the cows, the old milker reported the conditions, and the dairyman paid a fine for the dirt left behind by the discharged employee. Now, under present conditions, a spiteful milker has everything in his favor. The fine and reprimand should fall on the milkers personally, then they could be made to follow the law. The larger dairymen are putting in the milking machines, while the smaller dairyman feels that he must close out his business. The present prices of milk do not warrant the extra expense of sanitary handling.

Clean Milkers.

A force of clean milkers are humored, even petted on the ranch. They get coffee and pie at two in the morning. They are provided with a separate bunk house that their morning naps will not be disturbed. My foreman used to say that the milkers lay awake at night to plan something more to exact as price of continuous services. The milkers work less hours than other help, having two periods of three and half to four hours work during the twenty-four hours. The English and American workers usually leave the milking to the Swiss and Dagoes. When one is lucky enough to have Dagoes, Hollanders or Scotch milkers he is, indeed, fortunate. The fining of the milker instead of the dairyman is only following the custom of the Humane Society. They do not arrest the owner of the horse when the teamster abuses the animal. The dairyman has the inspector, the cow, the milker and the bacteria all to control; it is no wonder he wishes more pay for milk and cream. The thorns are many in his bed of roses, and grevious ones at that.

Stables.

This building must be one that can be kept clean. Board floors soon become foul with the liquid secretions At one time the board floor was th cheapest that could be put down now they are a luxury. Cement i the cheapest and best of floors for th cow stables. The gutter and aisle should be of cement; the stalls wher the cows stand are made of ordinar earth well tamped and treated t crude oil. The droppings the cow make as they come into the stable should all be removed before milkin begins. The cement floors are wel covered with gypsum, and the gutter have also a heavy coating on them A box of gypsum at one side of th stable is used to promptly cover al droppings in the gutters. Gypsum i needed on California soils, and it als acts as a conserver of the nitroger in the manure. While it may cos something, the use of it will greatl help the fertility of the soil after i has served its purpose as a deodorizer in the stables. Dry, clean roa earth is often used for the same purpose, and is said to be better tha nothing. I should prefer the eart from the plow furrows of the orchar or vineyard.

Routine.

The cows after milking are leased from the stable and the flo cleaned at first with a shovel an then swept. The gypsum is spre over them until they are white. Th stalls and surroundings of the cow should be whitewashed every mont A small tablet of corrosive sublimate is dissolved in the whitewash as it is good for disenfecting. I spraying it on the stalls, it is mad half strength or dissolved in doubl the amount of water. We believ there is no danger attending it use in this minute dilution. Th coal tar derivatives are the best o disenfectants, but are not advisabl to use, as they have strong odors tha the milk is liable to acquire. Th cows are carefully carded an brushed every day. This is bes done before turning out in the morning. The milk should be removed before any cleaning of cows or buildings is attempted. The hair from th thighs and stomach of the cow should be clipped, also any long hai growing on the udder. There wa once an old woman who took a candle and tried to singe the hair fro the cow's udder, but the cow we one way and the old woman th other in a forceful manner.

Bacteria.

The exposure for a few seconds a prepared gelatine plate in the co stable during cleaning time and o after the stable is clean and dust s tled, shows a great difference in th number of bacteria present. Th stirring of the hay, particularly alfalfa hay, sends thousands of bacte into the air of the stable. The cow udder should be washed if at soiled before milking. If no soiled, wipe carefully all dust fro them with a clean, soft cloth. Afte the cows are carded, turn them o to pasture. Then clean the manger of all waste foods and fill the rack for evening. Then clean out the manure and spread the gypsum; th will allow plenty of time for all du to settle before the evening milkin time. If any cow is dirty at the nex milking time clean her up outsid and avoid stirring up the dust. Afte the cows are in the barn, wipe o the udder flanks and stomach with dampened cloth.

Dry Milking.

Among other things to be absolutely insisted on, is dry milking; wet milking may be the calf's way, but it is too filthy a practice to dwell upon. I do not like, for this reason, to have the udder washed at milking time; the temptation is to leave them dripping wet. Sometimes there are heifers with teats so short that the milker's hands will be wet. The teats usually lengthen after a while and this milk can be placed in the calves' pails. Stagnant water in the pasture fields or water holes are often a source of the bacteria that produces slimy milk. The danger to the health of the cow makes it imperative that all these places be fenced.

Bacteria.

Bacteria multiply rapidly in fresh manure; covering the droppings with gypsum retards this action. The tuberculosis bacteria is said to come into the milk usually by the way of the manure, and more rarely directly from the udder of the diseased cows. If the stables are perfectly clean, manure has little chance to be found in the milk. The stable should be as clean as a parlor, no litter or waste products tolerated and no smells. In the barnyard droppings are taken up daily with a broad shovel, then when the rains come there will be clean earth and water and mud, not a pasty mass of manure droppings.—M. E. Sherman.

RED POLLED CATTLE.

Ask the average man to name the breeds of beef cattle and he would name Shorthorns and Herefords. Ask him to name the breeds of dairy cattle and he would name Jerseys and Holsteins. There are, however, many breeds of both beef and dairy cattle, and some that are good both for beef and for the dairy. The latter may properly be called dual purpose cattle, says a writer in Farm Ranch.

The Red Polled cattle are a dual purpose breed and a very good one. They are not as large or "beefy" as the strictly beef breeds, nor as delicate looking as most dairy cattle. They are a medium type. The Red Polled cattle must not be confused with the polled Durhams, for while there is a superficial resemblance there are marked differences. The Polled Durhams are merely Shorthorn catle without horns. They might be called Polled Shorthorns or "Hornless Shorthorns," for they are true specimens of the Shorthorn breed, tracing their pedigree along the lines of the Shorthorn race.

The Red Polled cattle, on the other hand, have a different pedigree—an entirely different history. The breed was formed in the early part of the last century by crossing the red horned cattle of Norfolk, England, with the polled cattle of Suffolk, England. The former were good beef animals and the latter, good dairy animals, and the fused product, the Red Polls, naturally partake of the qualities of both of the breeds from which they sprang. They have been recognized as a distinct breed considerably more than 50 years and are well known in England, the United States and the Argentine Republic.

The average weight of mature Red Polled bulls is from 1800 to 2200 pounds, though a weght of 2600 pounds has been reached by a very fine specimen. The cows weigh from 1100 to 1600 pounds. The head of a Red Polled animal is distinctly less "beefy" than the head of an animal of any of the beef breeds. They are also somewhat more nervous in temperament than Shorthorns and other beef animals, yet are very docile and easily handled. As dairy cattle they have a fine record. Lord Rothschild's herd of 34 cows averaged 6520 pounds of milk in the year 1900 and 43 cows averaged 6895 pounds in the year 1901. At the Pan-American dairy test in 1901 the Red Polled cows took fifth rank among ten breeds.

TAR DRIVES GAD-FLY FROM SHEEP.

This is the cause of the trouble, later known as "grub in the head." These flies are about half an inch long and deposit their eggs in July and August on the sheep's nostrils. As soon as they hatch the larva crawls up the nostrils and remains in the sinuses of the head, living on the secretions until the next spring, when it is ready to crawl out, always causing the sheep great annoyance, both in entering and leaving, and sometimes proving fatal in the latter instance.

Usually, however, if the sheep are well fed there will be no serious trouble. These grubs never go to the brain, as many believe. If the sheep can have access to a dark place in in which to lie at the season when the flies lay their eggs or some tar is smeared on the nose at this time once or twice a week there will be litle annoyance from this pest. There is no remedy worth while after the grub has entered the head; they will come forth in due season.—Farm Progress.

WILL IT PAY YOU TO BUY A TUBULAR?

FEBRUARY 26 70
MARCH 28 20
APRIL 27 00
MAY 24 00
TOTAL $133 50
COST OF SEPARATOR AND OIL 85 30
NET GAIN $48.20

THE best way to determine this question is to get out your pencil and do a little figuring.

You don't need to be an expert mathematician to figure this problem. In fact, to make it easier, we'll figure it for you and in such a way that you can easily see it in your own case.

If you are milking five average cows, not using a Tubular, you lose $5 to $6 a month—leaving butter fat in the milk, which a Tubular would get out. Then the better your cows the larger your loss—up to three or four times as much.

In a few months you would have made enough extra money out of this extra cream which you are now wasting—losing—to pay for a Tubular. Here's actual proof. Read what Mr. W. H. Bowler gained on his 5 cows by using a Tubular.

COLLINSVILLE, Ill.

"From five good Jersey cows while using the water separator we made from twenty-three to twenty-four pounds of butter a week; with one of your Separators from the same cows we made from forty-three to forty-seven pounds a week. I think it would take about $1000 to buy my Tubular if I couldn't get another."

W. H. BOWLER.

MOUNT AIRY, Md.

I am milking five cows. The increase of revenue, over the water can I was using, will pay the cost of the Tubular inside of one year. I think the Sharples Tubular far superior to any other separator.

EMORY PURDUM.

It is not a question any longer, whether it will pay you to buy a Separator—the fact is, you can't afford to do without one. Now the all important question is, which separator to buy?

Too many people have made the mistake of buying a low-priced separator only to find that instead of saving money on their purchase—they have wasted it entirely. Don't do this. Get the best at first—a Tubular—it's cheapest in the end.

Here are the reasons: It skims closest. Has fewest parts. Easiest to clean. Low supply can saves your back. Turns easiest—is frictionless ball bearings. Wins in every competitive test. Made in largest Cream Separator Factory in the world. More sold each year than any other.

Send for our new catalog No. 260 it's full of more good reasons and proofs from those who are using them. It's free—we'll also send a copy of our book "Business Dairying" which will help any one keeping cows to get more profit from them. It's worth a dollar of any farmer's money.

The Vegetable Garden

SWEET POTATO CULTURE.

In our issue of January 2, Mr. Lobingier, in answering a query as to sweet potato culture from a Riverside subscriber, gave directions regarding propagation and culture of the sweet potato. This was from Mr. Lobingier's standpoint, and from his experience in Southern California, we doubt not, correct. But since then two communications have been received from subscriber's in the North showing the cultural condition there somewhat different. The first of these communications is from Mr. J. C. James of Atwater. He says that the plan suggested by Mr. Lobingier is not followed in Merced county, but that the method there most successfully used is as follows:

In my 20 years' experience in Merced county I never knew of but one experiment to raise sweet potatoes without a hot bed and the experiment brought the plants about one month too late for profitable planting, therefore we use the hot bed that we may secure profitable plants. This is our method:

The Hot Bed.

Dig a trench, the width is immaterial, for convenience about four feet wide and two feet deep is about right. Put in the bottom some straw (bean straw is fine) or corn stalks, tramp it down until it is about eight inches deep, then put in stable manure to about five inches from the top of the trench. Now put three inches of soil, then lay the potatoes. We lay them close together (for the reason that we get more plants to foot of bed.) Cover them with light rich soil about three inches deep.

Now notice that there is a very shallow depth and consequently care must be taken not to allow it to become dry, for that reason if it does not rain we employ the sprinkling can; do not allow the bed to get dry either below or above but do not turn water on unless it needs it. If your bed is unprotected make a windbreak to shut off the north wind. Get all the sunshine.

In the Field.

After the plants are big enough to set out, and no danger of frost, take from bed, put one hand on the tuber and hold it there and pull off the young plants with the other hand.

The usual method of making ridges, is best because it warms the soil further down and consequently grows longer tubers, and the deep furrows also hold more water which means perhaps less frequent irrigation.

To make ridges they should be one yard apart, so as to acommodate, or fit the planter; then each wheel will be in the center of the furow and keep the shoe on the center of the ridge. The same width is all right for hand planting because it is none too wide for the cultivator. Instead of following with water it is better to send the water ahead of the planting and also the water should be turned in the row just finished so it will leave the ground thoroughly irrigated, otherwise plants may die. Proceed as follows: with the left hand make a hole, dip out of the furow and nearly fill the hole. The planter follows; put the plants in the water or mud, then throw on a handfull of dry soil to prevent baking or crusting.

Now keep your ground in good condition; if you don't know enough for that go back to the bargain counter.

* * *

Another, Mr. George Russel of Murphy writes as follows:—

"I think your answer to the question regarding the growing of sweet potatoes does not cover all the ground. The sweet potato is a tropical plant, therefore the longer the growing season the more potatoes the grower will get. If the potato grower will select a warm spot on the south side of a building, or any place that is protected from the colder rain, and will be where the sun will shine on it all day, it will give best opportunity for the sprouting of the tubers.

The Hot Bed.

Dig about twelve inches below the surface of the ground, fill with good, fresh horse manure, which should be well tramped down. This should be done at once, and even now it is late. Set boards at least a foot high on edge around this hole which has been tramped full of manure, level with the ground, packing dirt around the outside to hold them firm.

After thoroughly wetting this manure put a covering of good sandy loam to a depth of six inches. Make a covering for the bed. It may be of boards, but preferably of muslin, which may be placed over the beds at night and on stormy days. Keep the soil and the manure about as moist as you would for the best condition of your growing plants. In about three weeks it will be warm enough to put in the seed. Lay the seed as advised by Mr. Lobingier in the former article and cover with same kind of soil, to a depth of nearly six inches.

Prepare 100 square feet of such a bed for every acre to be planted about 250 pounds of seed to the acre, as a general rule. Of course, the bed must be kept open during warm and sunny days and always moist. If everything has been properly done up to the last week in April or first of May, you will have a fine bed of plants ready to plant from 8 to 12 inches in length. They must go to the field as soon as possible in order to secure the long season.

Field Culture.

The field ground should be prepared at least a week beforehand, and two weeks is still better. Set on ridges three feet apart and 15 to 18 inches on the ridge. I have always grown them on ridges, yet I question that practice in all sections of the arid country. I am growing Irish potatoes with all success with level culture. I have no experience growing sweet potatoes by irrigation, but there is one thing I am positive about and that is, that moisture must be uniformily maintained with both sweet and Irish potatoes.

In regard to setting sweet potato plants by dropping them along the row prepared for them, take a hard wood stick, shaped at one end so that it will be readily pushed into the ground, and with it press the root into the soft, well prepared loam. This should be quite deeply pressed into the groung to within two or three inches of top.

The early sweet potato, like all other early products, is the one that pays best. If the ground is dry at setting time, irrigation must be given, but in my section I have always done better without the water.

IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

RAIN CHART.

The Security Savings Bank is again out with its valuable rain chart of Southern California. This chart is reliable, and is so valuable that thousands are sent for every year.

Any reader who will mention the Cultivator will be mailed a copy of the chart. It's well worth sending for.

By the way, we may be permitted to remark that the bank is also absolutely reliable, and will handle farmers' money as it has that of thousands of business men, successfully and honestly.

THE 20TH CENTURY GRADER AND DITCHER.

We call attention to the advertisement on another page to the new road and ditch maker, the "20th Century." This is eminently a practical machine whose cheapness brings it within range of almost every rancher in the country. Irrigators, township trustees and city councils should investigate this machine and write the Agency for information about it.

FUMIGATION

Continued from Page 160.

Usually an outfit of tents consists of from 30 to 33 tents, the usual number of trees to a row.

The Crew.

The crew for, say 45-foot tents, is a foreman, a helper and four tent throwers. Experience has taught that they must all be paid good wages or that the result will be that, for one reason or another, your help will be constantly changing.

As each orchard is finished, the cyanide that is left is taken to the barn, weighed and credited to that account. As each row of trees is finished, the tent throwers transfer the tents to the next row and the foreman and helper follow with the chemicals in the cart. They place the fumigating jars under the next row and drop in the chemicals.

Time.

Forty minutes is usually accounted about the right time of exposure to gas for black scale; but for the red or purple scale. it is much better to leave the tents on a full hour or more.

Dosage.

This brings us to the much debated question of dosage, and the following table is as we use it for black scale. For either red or purple scale or pseudo cocus, double the amount of chemicals and use four times the amount of water instead of three:

Height (Feet.)	Diameter. (Feet.)	Cyanide	Sulphuric Acid Fluid Ounces.	Water
16 to 18	16	14 ounces	14 ounces	42 ounces
14 to 16	14	12 ounces	12 ounces	36 ounces
12 to 14	12	10 ounces	10 ounces	30 ounces
10 to 12	10	8 ounces	8 ounces	24 ounces
8 to 10	8	7 ounces	7 ounces	21 ounces
6 to 8	6	5 ounces	5 ounces	15 ounces
4 to 6	5	4 ounces	4 ounces	12 ounces

In fumigating for either red or black scale, if the operator at any time finds conditions not quite right and yet he wishes to continue fumigating, it would be safer to use four times the amount of water instead of three times as given in the table.

There are always differences of opinion as to amount of dosage, and I expect some fumigators will differ with me. But, close observation, both before and after the work, has proven that the heavier dosage pays. Working according to this table we have shown that we can kill at least 99.9 per cent of all scale. In my work as horticultural commissioner I have examined the work of, many fumigators and I have usually found from two per cent to 25 per cent of scale not killed.

A Few Dont's.

It has always seemed a pity to me that when an orchardist has to stand the expense of covering the trees with tents in any event, that poor work should result from the lack of two to four ounces of chemicals to the tree. Used at the time the increased expense would be but little. While the lack means that the work must be done again in a short time, thus nearly doubling the expense.

As a rule, the best time of the year to fumigate is from September first to February first.

I will close with a few don'ts.

Don't try daylight fumigation, for sooner or later you will come to grief.

Don't fumigate when it is wet or rainy.

Don't fumigate after the dawn of morning.

Don't fumigate when the north wind blows.

PRUNING LEMON TREES.

Continued from Page 165.

natural that there should be a more or less marked disparity between this and the practical. The lemon is naturally a large tree and it appears that, though fruiting can be hastened and stimulated by cutting severely, a certain amount of wood growth must be provided for sooner or later. a run-down grove can be made to How much this is the result of the present practice of abundant fertilization, is indicated by the fact that a run down grove can be made to bear almost at once by a severe cutting. After this same grove has been properly cared for for a few years, it is necessary to rebuild this top in order to keep a proper balance, and if this balance be properly maintained, it will not be necessary to cut as incessantly as where the vegetative results of the grower's own fertilizer is too much subjected. Suckers cut from a tree deficient in top are not eliminated as hoped, but half a dozen more are forced out from the base of the one removed and the task thus multiplied, for the tree must at all events be kept "open."

Keep the Eyes Open.

With the large grower there is ample opportunity to study these things, and where he has his own pruners it is natural that they should work out a system in advance of the common practice, and naturally, too, that we should look to them for a solution of such problems. The small grower doing his own pruning and unable to study from outside his own neighborhood, and the grower new to the business is likely to be found clinging longest to the old practices, and to them should the services of experienced pruners, who are observers, be most useful.

It was suggested in these columns several weeks ago that these men possess certain tricks of the trade in regard to time and method of pruning, tricks which they learn by long pursuit of their vocation, and which are more useful than any method that can be defined on paper; really, the vital items in training lemon trees for crop results. These men should be encyclopedias of information and much should be required of them by their employers. Indeed, association with these experts at their work, shows that many of them are perpetually putting into use details of the utmost importance, which may be expressed only by actual demonstration. These details, like most others of this wonderful industry, require careful observation and much experience, not in a single grove but in many groves on many varieties of soils, with a great diversity of treatments and natural conditions, and after following the work of many predecessors.

A REMEDY FOR PEAR BLIGHT.

The pear blight which has destroyed thousands of acres of pear orchards of the State, is now promised its finish in a new remedy which is being placed on the market by the Pear Blight Remedy Company of Vacaville.

The company is composed of good people who claim to have a good thing and a sure cure. Mr. Fred M. Buck, the president, is a very large fruit packer. Dr. F. Lengfield, a prominent physician of San Francisco, is vice-president. Mr. Q. Blum, secretary, is one of the firm of Blum Bros., fruit packers at Vacaville, who have been located at the place many years.

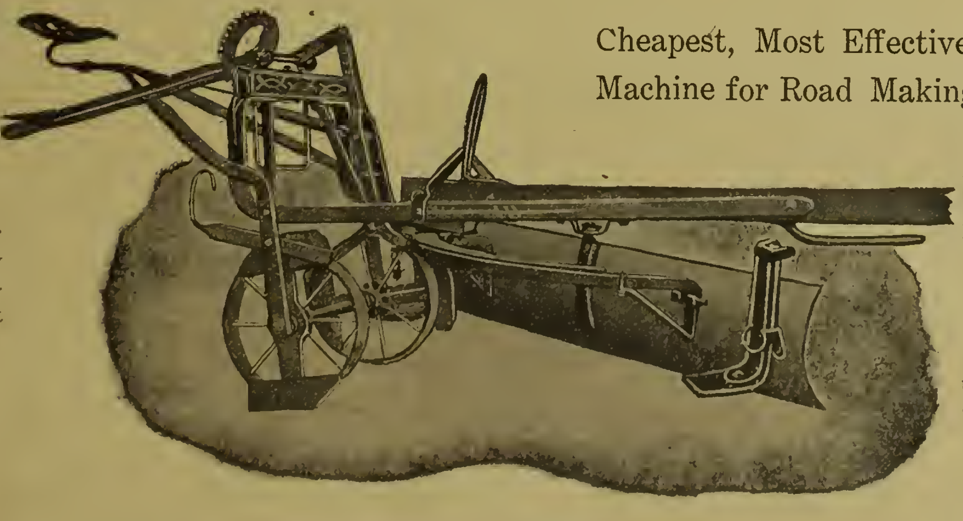
This remedy is applied to the roots of pear trees; it is taken up with the sap, and those who have observed it, say that it does the work successfully. A letter to the firm at Vacaville will bring more complete particulars regarding this remedy.

—The—

20th Century Grader

As a ditcher for ranches and a maker of laterals for alfalfa irrigation, it is a complete sucess. Read the following testimonials from well-known California beet raisers. Also note the popularity of the machines generally, as evidenced by the following letter from the Lyons Implement Co., San Diego.

Nov. 23, 1907.
John Shilling, Jr.,
c o Davis Warehouse, Central & 2nd Ave.,
Los Angeles, Cal.
Dear Sir:
Replying to your favor of the 22nd, would say that the grader was duly received and the report is that it is doing good work.
Yours very truly,
MONTANA LAND CO.,,
A. W. Jones, Agent.



Cheapest, Most Effective and Simplest Machine for Road Making in Existence

Jan. 27, 1908.
Mr. John Schiling, Jr.,
Los Angeles, Cal.
Dear Sir:
Please ship us at once by freight 2 20th-Century Grading Machines. We have just sold the last of our stock and they have all given good satisfaction. Trusting that you may be able to ship at once as we have one good prospect in view.
Very truly,
Lyons Implement Co.,

Requires only one team and man. Does the work in any soil and on any reasonable grade.
For city and town roads and rural districts it is unsurpassed. Saves money and makes durable level surface. Specially adapted for hillside work on ranches or roads. Does the work of plow, digs up sod, makes gutter, curved roadbed which sheds water.
Write for descriptive catalogue prices and information concerning this machine, which is the cheapest and best machine for the kind in the United States to

THE LAND OF "I FORGOT."

Little Trit-trot was a poor little slave
In the land of "I forgot."
He ran and he ran the livelong day,
Did little Trit-i-ty Trot,
Who lived with his mamma just over the way,
In the land "I forgot."

It was "Where is my hat and where is my cap,
And where is my brand-new ball,
And where is my bat and my catching gloves?
I cannot find them at all."
And he hunted and looked upstairs and down,
In kitchen, chamber and hall.

The hat was found in the top of a tree,
By the side of a tattered kite.
The cap was left in old Blackie's nest,
When he gathered the eggs at night.
The hat was wet and the cap was torn,
And both were a sorry sight.

The ball and the bat and the catching glove
Were down in the pasture lot,
And the slate and sponge and strap and books
Had hidden under the cot.
For this is the way things lose themselves
In the land of "I forgot."

—Mary Morrison in Youth's Companion.

THE ARRIVAL OF WINCHESTER.

An ancient phaeton attached to a staid old horse stood in front of a handsome home on a shaded side street. The phaeton was broad and comfortable, the horse fat and sleek. He was a pampered horse and wanted to get home to his comfortable stable. He expressed his uneasiness by softly neighing and by little starts and backings. He knew his mistress was a caller at the house in front of which he was tied, and he wanted to let her know that she was prolonging her stay beyond reasonable limits.

Presently, as if to illustrate his pangs of hunger, he dropped his head, and, craming the phaeton about, began to nibble at the short grass near the curb. The nibbing was not good for the shaven lawn. The nosing horse not only nibbled, but he brought up a tuft or two with the tender roots attached.

A young man who was sauntering down the streeet saw the mischief that was being wrought, and, stepping quickly to the head of the horse, drew him away from his meal. He was shortening the halter when a young fellow came through the gateway. The new-comer looked at the nibbled sod and then at the young man.

"What do you mean," he sharply demanded, "by tying your old brute in front of this house?"

"The young man had turned from the hitching-post and looked over his shoulder at the new-comer.

"Am I to infer that your remark is addressed to me?" he quietly asked.

"Of course it's addressed to you," the new-comer answered in still louder tones. "See the damage your wheezy old plug has done! Hustle him away or I'll kick his ribs in."

The young man pulled the halter tight and turned to the angry youth.

"That's foolish talk," he said. "The damage is only slight." He pressed the sod down lightly with his foot. "The first shower will make the lawn as good as new."

The angry youth grew angrier.

"I ordered you to take that horse away. Will you do it?"

"No," he replied.

"Do you understand that this is my home?"

The young man glanced at the house.

"A very attractive place," he said.

The angry youth stepped forward quickly and kicked vigorously at the old horse. But the kick fell short. The young man caught him as he plunged forward, and with a quick shove from his right arm thrust him half way across the sidewalk.

"You musn't try that," he said. His voice was steady, but he breathed a little more quickly. "Only a cowardly bruite would kick a horse. I'd much rather have you try to kick me."

The youth had been dazed by his sudden impulse. Now he put his head down and leaped at the stranger. He was a youngster of heavy build, and his rush was formidable. But the stranger side-stepped a little, and, lightly countering the blow that was aimed at his breast, struck the youth smartly across the face with the back of his left hand.

"Stop this foolishness," he growled, his face suddenly darkening.

Before the youth could reply a clear voice hailed them from the steps of the house.

"What's going on there?" the voice cried.

The two men looked up. A stout, old woman was coming down the steps, a plainly dressed old woman with beautiful white hair.

The angry youth stared at her for a fleeting moment, and then turned around and walked swiftly down the street. The young man held his ground.

"What are you doing with my horse?" inquired the old woman, as she came through the gate.

"I am untying him, madam," replied the young man.

The old woman stepped into the phaeton and the young man brought the hitching strap to her.

"Is your time of any particular value, young man?"

"No, madam."

"What do you say to taking a little ride with me?"

The young man laughed.

"I'm quite sure I should enjoy both the rest and the company."

And he took the seat beside the woman.

"I'll promise you not to break any speed regulations," she said as she took up the reins. There was a little silence, and then she looked around at her guest. "I overheard part of that boisterous talk back there," she said, "I'm glad you didn't let the youngster kick old Major. What's the matter with your hand?"

He quickly covered the scraped knuckles.

"I'm afraid I slapped the boy harder than I intended," he said.

They were passing along a well-kept road in the suburbs, a road that seemed little traveled, however, when they came in sight of a stranded touring car. It was a handsome car, and a handsome young woman was in the highway beside it. She looked up quickly when she heard the sound of old Major's hoofs.

"Why, it's Aunt Mary," she cried. "Isn't this provoking?"

"What's wrong, Emily?"

"I'm sure I don't know. Every-

ng was all right when I started. ran beautifully until just now. It's the more provoking because I was ng down to meet papa. He's com- home tonight, and he'll expect . I'm sure I don't know what I'll " Her gaze swept across the ing man, and then returned to the .

The old lady looked around.

'Are you clever at anything be-es fighting?"

'Try me," he said.

'Perhaps you know something out engines?"

'Yes, ma'am."

"Can't you help this poor girl out her trouble?"

"Madam," said the young man, "I your guest. Do with me as you ll."

"Well, you heard her say she want- to meet a train, didn't you?"

The young man stepped from the aeton and approached the car.

"Will you permit me?" he said litely, as he removed the hood. ien he stared hard at the engine. e girl stepped to the side of the aeton.

"Who is he?" she whispered.

"He hasn't told me."

"Then he's merely one of your ck-ups?"

The old lady suddenly laughed.

"Yes. He won my heart by stop-ng a youngster who tried to fight d Major. I've invited him to din-r."

"Auntie!"

The young man had taken off his t and coat and was busy with a rench and screwdriver.

"This engine is in a shocking con-tion," he said. "It needs a thor-igh cleaning. I'd like to get at it id freshen it up."

He put the hood over the engine id replaced the tools in their box. hen he tested the engine. It caught e spark instantly and ran with a umming smoothness.

"Thank you so much, Mr. ——" id Emily.

'Quite welcome," he answered.

"Thank you, Mr. Quite Welcome." The old lady smiled.

"I wish you'd come over to dinner -night, Emily," she said.

"I'm afraid I can't. Will there be nybody there I know?"

"No. Let me see. I've invited omebody whose name I can't recall. Von't you come?"

"I'll [illegible], Auntie. I suppose papa ill bring home with him that clever ng engineer he's so fond of talk-g about. Papa has made him the onsulting engineer of the road, you now. I suppose he'll be awfully ff and tiresome. If he comes I [illegible] get away."

"Well, if he doesn't come, run ver and bring your father, too. ell him I'll have the coffee just the ay he likes it."

"I will." She stepped into the car. he young man cranked it.

"Thank you again, Mr. Quite Wel-ome," she said.

He lifted his hat and the car sped own the highway. Then he re-umed his seat by the old lady, and he old horse continued his journey.

"This is my house," said the old ady as the ancient horse passed hrough the broad gateway.

It was a fine old colonial house in he midst of beautiful grounds, and he young man looked about him with pleasure.

"I fell like an Interloper," he said.

"A good wash will make you feel ike something more pleasant," the ld lady assured him.

And presently when he came down stairs he showed a marked improvement in appearance.

A distant bell rang softly.

"I have invited you to supper," said the old lady. "No matter what you may be, my hospitality must take its course home."

She led the way into the dining room and pointed out his seat at the table.

And then the girl suddenly reappeared. She was followed by a gray-haired man of fine appearance.

At sight of him the young man suddenly arose.

"Why, Winchester!" cried the gray-haired man, and put out his hand. "This is a pleasant surprise. Why didn't you tell me he was here, Emily?"

"Eh? Haven't you met him? This is the man you've heard me mention on several occasions—our new consulting engineer. Winchester, my daughter, Emily." He looked across at the old lady." She was laughing merrily.—W. R. Rose, in the Cleveland Plain Dealer.

CITRUS RECIPES.

Grapefruit Marmalade.

Take four large graefruit, slice thin and remove seeds; for each pound of fruit add one pint of water. Let stand twenty-four hours; boil twenty minutes till tender; stand again twenty-four hours. For each pound of fruit add one pound of sugar and boil till jellied.

Orange Dessert.

Take large, ripe oranges and cut in shape of a basket with handle; remove all the pulp and seeds, leaving the inside clean from any moisture; then soak a small-sized package of gelatine in a pint of cold water; let this stand until you have the syrup made to pour over the gelatine. To make syrup squeeze the juice of ten oranges and two lemons; remove every seed, as it will be bitter. Rub two oranges with a lump of white sugar so as to make each lump very yellow and oily; in this way obtain the flavor of the peel; take two pounds of white sugar and a pint of water, and boil three minutes; when a little cool, add juice of oranges and lemons and gelatine; set away to cool until it forms a jelly, then fill your orange baskets with this jelly. Just before serving, put a little whipped cream on top of jelly, or white of egg whipped very stiff; then tie a little bow of pale green baby ribbon on handle of orange and place orange basket in a saucer with orange leaves, so the points of the leaves will be at the outer edge of saucer. This makes a beautiful dish for the table.

Lemon Marmalade.

Take two dozen lemons, roll until soft, cut in halves, squeeze the juice into one bowl and the pulp into another. Boil the skins till tender in plenty of water, tightly covered; when quite tender, take them out and cut in shreds. Wet a cloth in cold water; strain the juice through and squeeze the pulp, adding a little cold water to the pulp. Measure the water, chips and juice and to every pint put one pound of white sugar. Boil for twenty minutes, or till it begins to jelly. If boiled too much, the skins will be tough.

Orange Chips.

Cut the oranges in quarters and carefully squeeze all juice through a sieve. Soak the peel in water, and the next day boil it till tender; drain. Slice the peel, put it to the juice, weigh as much sugar and put all together into a broad earthen dish; place over the fire at a moderate distance, often stirring, till the chips candy; then set them in a cool room to dry. They will not be dry under three weeks.

Orange and Lemon Jelly.

One ounce gelatine, one pint water, one-half pound sugar, thin rind of two oranges, juice of eight navel oranges and one lemon, let it gradually come to a boil, and boil one minute; strain through muslin into jelly tumblers. By using one pound of sugar with the rind of two lemons, juice of six lemons and juice of one orange, you will get an excellent lemon jelly.

Orange Sherbert.

Make the cups by cutting a slice from the top of each orange, using the pulp and juice for the sherbert. Cut each cup in points; set away on ice. At serving time place the cups on pretty plates; garnish with holly or fern, fill with orange sherbert, placing a star of whipped cream on top of each orange. To make the sherbert, take one quart of orange quice, two cups strained pulp; sweeten to taste; put in freezer, when nearly frozen, add the white of one egg whipped light, with two tablespoons sherbert until ready to serve.

Orange and Pomelo (or Grape Fruit) Sherbert.

Take one quart of pomelo or grapefruit juice, sweetened to taste; add two cups of orange juice to one of sugar, stirring until the latter is dissolved; pour this on the grapefruit juice and then turn into a freezer; when nearly frozen, remove the dasher, and put in the white of an egg, whipped as light as possible, with two tablespoons powdered sugar, beaten in with a large spoon; after beating in this manner the sherbert is to be packed and put aside to ripen.—Los Angeles Times.

Orange Pie.

Grated rind and juice of two oranges, four eggs, four tablespoons sugar, and one of butter; cream the butter and sugar, add the beaten eggs, then the rind and juice of the oranges, and, lastly, the whites beaten to a froth, and mixed in lightly. Bake with an under crust.

Orange Souffle.

Peel and slice eight oranges; put in layers in a glass dish, with sugar between, and let stand several hours; make a soft, rich custard and pour over the oranges; spread over with a rich meringue.

HOMELY HINTS.

When anyone is exposed to a contagious disease that person cannot do better than use a gargle of equal parts of lemon juice and water and drink strong lemonade frequently.

If you are suspicious of the drinking water and cannot boil it or get better, use the juice of a lemon to a glass. The strong germicidal action of the juice should purify it.

In arranging the toilet of the sick, add lemon juice to the water used for bathing; it is refreshing and will reduce fever.

To clean the mouth, teeth and tongue of a patient, rinse or wipe with lemon juice slightly diluted.

The juice of a lemon in water, before breakfast and at bed time, is good for bilious troubles. Keep it up for several days.

Never drink the pure juice, always dilute it.

Bee and insect stings are relieved by a few drops of lemon juice.

Seventh Home Extension

The location of our Seventh Colony is 7 to 12 miles south of the City of Bakersfield. It is

Chaney; treasurer, Wm. Johnson; executive committee, J. E. Boynton, Thomas Flint, Herman Schultz, A. Vehmuller, N. C. Briggs, Jr.

The Produce Market

Los Angeles Markets

LOS ANGELES, Feb. 12, 1908.

Butter.

Owing to the almost complete cleaning up of Eastern butter, prices have been materially advanced. Receipts of local creamery are very liberal, but on Monday an advance of 7½ cents was made. At present quotations the market is firm and sales brisk.

Creamery ex per roll	67½

Citrus Market

LOS ANGELES, Feb. 12, 1908.

The prices offered for oranges are
ot fully up to desires of growers. The
eather in the East is very unfavor-
ble. The cold has driven in all buy-
s and almost no inquiry prevails.
ortunately the storms in California
revent extensive shipments. Friday
nd Saturday's shipments were heavy,
ut the Sunday storm stopped picking
gain so that it is hoped the weather
t the Eastern end will turn favorable
nd clean up stock in hand before
eavy shipping begins again. Less
han 100 cars per day are being for-
arded at this time. By the first of
larch the shipments will probably ag-
regate 150 or more cars daily.

There has always been one peculiar feature regarding February shipments. They have for three years shown a less daily shipment average than either January or March. It now appears that this year will be no exception.

Lemons are firm and shipments going forward freely. Some foreigns are coming, but not seriously interfering with the market.

Shipments.

Total shipments of citrus fruits since Nov. 1, 1907, 6788 cars, of which 1151 were lemons. To same date last year, 5728 cars, of which 724 were lemons.

NEW YORK, Feb. 10.—Market is easier on navels. Practically unchanged on lemons. Weather clear and favorable. Twenty-five navels and two lemons sold.

SUCCESS

in raising young chicks depends greatly on the feed given to them for the first six or eight weeks.

BY FEEDING

COULSON'S SPECIAL DRY CHICK FOOD

during this early stage you will get the chicks through their time of danger in a healthy and vigorous condition.

THE REASONS FOR THIS ARE MANY—First, each ingredient is carefully selected for its purity, wholesomeness and fitness as a food for a baby chick. Then the strength is considered. A *specially strong* grade of *wheat* is used, as well as *steel cut oats, millet,* and the *best* of *meat.* These are all carefully granulated so that the chicks do not get anything too large, and the grains, etc., are mixed in sufficient variety to *insure* a *perfect balancing* of the different properties which go towards *growth* and *vigor.*

Then again the feed being *free from dust,* can be fed in straw or litter, inducing exercise, and *increasing the strength* and *health of the chicks.*

These are among the reasons why you cannot afford not to feed

Coulson's Special Dry Chick Food

It Insures Your Success

If you do not know where to get it write to us and we will tell you our nearest local agent.

The Melon Aphis

Prof. C. W. Woodworth of the State University Writes of the Aphis Which Has Devastated Many Melon Fields in California. He Has Been Making Investigations at Whittier Station for Some Weeks

EVERY year there is more or less loss experienced by cantaloupe growers due to the work of the melon aphis.

This plant louse is now present all over the lley, particularly common on pepper grass and ore rarely on alfalfa, and as soon as the cantaupes are out of the ground they will be in danr of becoming infested.

hat to Do.

Every grower of cantaloupes should, therefore, ke immediate measures for the destruction of such weeds as pepper grass along ditch banks d roads for a quarter of a mile at least from field he is planting to this crop, particularly wards the direction of the prevailing winds. alfa fields should also be very closely pastured the next few weeks so as to remove all rank wth which serves as food for these insects.

e Life of the Melon Aphis.

he melon aphis is a very widespread pest, be- found all over the United States, and attack- a larger number of kinds of plants than any er known species of aphis. It was first de- bed as a pest on cotton, and is the common k aphis of citrus trees and attacks a large of weeds, including pepper grass, pig weed dock.

he full grown aphids are of two kinds: A y prolific, wingless form and a wandering ged form. The wingless lice are produced n the conditions are most favorable for wth. Their rate of reproduction is incon- ably rapid. A single aphid could easily have y hundred million descendants in a month. winged form, while very much less prolific n the other, is quite as important to the grow- since it is the same by which the species dis- utes itself. When a winged louse finds a rable spot it settles down and is soon sur- nded by a prosperous family of the wingless l.

itering.

ll the individuals in the case of this species females; males have never been seen, and all g forth living young as far as obsrvations have gone, except that once in Illinois, what appears to be the same insect, was discovered depositing eggs on strawberry plants late one fall. It is probable, therefore, that in regions where there is a long winter an egg laying form is developed. Here in California the insect is active all winter and eggs may never be produced.

Ants and Plant Lice.

The idea is quite prevalent that the ants that attend them and feed on their excretions in the summer take care of them over winter. One species of ant has been proven to do just this thing in the case of another species of aphid attacking the roots of corn. There does not seem to be any evidence, however, that anything of the kind occurs here. Small colonies are not usually accompanied by ants. The honey-like secretion of the lice is so attractive to ants, however, that before a colony of lice becomes very large the ants will usually have discovered it, and then remain in constant attendance.

Disappearance of Aphids.

No other species of plant lice presents in a more striking form, the phenomenon of the complete disappearance of apparently prosperous colonies. One may see today a thriving colony where everything seems favorable for their growth and continued development, and the next time one looks for it, only a few cast-off skins and perhaps a few mummies of parasitized or fungus-infested individuals remain to mark the spot where before there were hundreds or thousands of living creatures.

If there are a few ladybirds present they are usually credited with having eaten them up, but I have never seen ladybirds abundant enough to eat more than a very small fraction of the number present, and the disappearance is equallly as sudden and complete where no ladybird or other predaceous or parasitic insect is present.

These disappearances are probably due to some general condition, since a whole orange grove, for instance, will become suddenly free from this aphis. In the melon fields one may be badly injured and the next one scarcely at all, though both may have been apparently nearly equally infested. In one case the colonies thrived and the other succumbed. One of the lines of study the writer proposes to take up this season, is to determine if it is possible to so control the conditions of a field that the plant lice cannot thrive.

Remedies.

The measures usually recommended for this insect are spraying with kerosene emulsion or with tobacco decoction, or fumigation with carbon bisulphide, nicotine or cyanide. We may experiment along all of these lines this season. Melon vines are very difficult to spray, but could be handled at an expense of somewhere between five and ten dollars an acre. Fumigation, while proven to be very affective on a small scale, has never been developed into a practical method for large scale work for field crops. After it is put on a practical basis and one has gone to the expense of suitable covers or tents, the actual cost of treatment would probably not be very much greater than for spraying. It is doubtful, however, if either of these will be very practical under our conditions.

Recommendations.

At the present time the measures we can recommend are as follows:

Look after weeds as suggested at the beginning of this article. The lice flying from weeds or from alfalfa fields, as far as we know now, are the sole source of the infestation of a field, and pepper grass is by far the most important source. Especially should one look out for weeds to the windward, since the direction of their fight is largely determined by the wind. This preventative measure is of prime importance.

Keep watch of the fields and annihilate every colony as soon as found. Each insect flying into a field and establishing itself upon a plant will usually then cease its wanderings and thus infest only a single plant, and may be discovered before it has infested more than a single leaf or the growing tips of a vine. This work of inspecting should be kept up till the infestation begins to become too general to cope with, and by that time, perhaps, the worst danger from the insects will have passed.

Deciduous Fruit Cultur

FRUIT GROWING IN CALIFORNIA.

THE geographical location of California, together with its topography, gives to the State an advantage from a horticultural point of view that can not be duplicated with a combination of several States that are prominent in fruit growing. California keeps pouring into the markets of the world a stream of fruits every day in the year fresh from the trees. There is no well defined season for the harvesting of fruits. At the time citrus fruits are still leaving the State in train loads, the desert section commences with its early fruits and vegetables and by the time these are cleaned up, the large valleys of the central portion of the State begin shipments of the same products and continues to do so till late in the summer, when the coast and bay regions take up the same products and so continue till winter comes, when the citrus harvest again is in full swing.

Diversity.

Where can we find such a diversity of products coming into the markets throughout the year as we find here? Southern California alone has a varicty of products that in itself is hard to duplicate. Within a radius of fifty miles are grown winter and early summer apples, lemons and limes, oranges, walnuts and lima beans, pineapples and winter tomatoes, grown on a commercial scale in the field, and requiring at least four different classes of climatic conditions. As stated above, California enjoys the distinction of possessing three distinct climates in which the same products may be grown and matured in as many different seasons of the year. An immense area at the extreme southern end of the State, harvests its cantaloupes in June, its tomatoes in April, May and June; also its apricots in June, and its oranges in October and November. Northern and Cent California follows with the s products just after the desert co try finishes its harvest, and t comes the coast regions with anot installment of the same produ Aside from this, certain sections particularly adapted for rai special products. Here the spec ists in horticulture find ideal co tions that have made California mous.

The climatic conditions render manipulations of the soil and t somewhat different in the diffe localities. For instance, in the ert regions rain is not counted and, in fact, is not desired, whil other sections rain is essential its occurance renders practice tirely different.

Big Claims Injurious.

The fruits that are raised in sections subject to rain and sold on their beauty of c as much as on their real qua are inferior when raised in the r less regions. The quick maturin the fruit prevents coloring and, consequence, the products that much on their looks are not ada to the desert country. Here fruits that naturally have li color, ripen and develop to per tion long before the same vari elsewhere are grown to full size.

With one or two exceptions, desert grower must confine his pl ings to light colored fruits, espe ly grapes. The fact that in this gion grapes come into bearing second summer after planting cuttings, the fruit being ripe and of the way before same class of is ripe in other sections, has sti lated a big demand for grape v and cuttings, and the chance for takes is great. Planters being anxious to secure vines and cu are apt to be the victims of uns ulous dealers.

There is one statement that gone the rounds that is liabl cause much loss to grape gro It has been and is now being and published, that one acre of ple Cornichon grapes netted grower $700. This is true, bu was a mere chance. Having the grapes in the vineyard at time of picking, we are in a po to judge. The grapes were a steel grey in color when ripe were devoid of flavor. Some sent to the Los Angeles marke were thrown onto the garbage They were so utterly poor in a ance and flavor that no one buy them. The bulk of them shipped to Chicago, where they in competition with edible g and they were promised the fate that came to the Los A consignment, but a brother o shipper happened to be in C when they arrived and knew tha New York market was bare sent them right on where they bid in by dealers at several d a crate. How the dealers got them we could not ascertain. grower decided not to take any chances and will graft them o another variety. Flaming Tok planted to some extent and poor quality. It, however, brin fair prices as White Tokay It East.

through refrigeration in good shape. Malaga and Purple Damascus have done this, and there may be some other varieties that will do as well. Luglienga and Persian No. 21 are promising. These are white grapes with an amber coloring, that gives them the appearance of the Thompson Seedless, which is a favorite grape in all the markets. These two varieties are, however, much earlier than Thompson Seedless, and are considered by many to have a better flavor. It is gratifying to find in California one place where the Luglienga does well. It was imported many years ago by the California Experiment Station and recommended as a good arbor grape, being the earliest ripening grape known at that time. It proved to be one of the most barren varieties wherever it was planted, until it was sent to Indio some years ago where it proved to be a heavy bearer. It was afterward sent to the Imperial valley where it also proved to be prolific. It has so far proven to bring best returns per acre of any grape grown in the desert region, when shipped to the local markets. Its shipping qualities under refrigeration have not been tested.

Near the Coast.

Near the coast, Purple Cornichon and Tokay color well and are good late grapes, as grown in Southern California. In the interior valleys of the north and central portions of the State these two varieties of grapes are grown at great profit. The red, sandy loams in the San Joaquin valley and Sacramento valley produce a Flaming Tokay that is unequaled in any other section of the State. They ripen in the proper season and develop a high flavor. In many places in the Sacramento valley, and especially in Yuba county, Purple Cornichon and Flaming Tokay are grown in the same vineyard, though they require entirely different soils. While the Tokay requires a red, sandy soil to mature the best color, Cornichon needs a heavy soil with a red or yellow subsoil to develop properly. "Ridge" land has this combination, Tokay's doing their best on the ridges and Cornichon on the low land. Here, also, Thompson Seedless does particularly well. Certain lands around Fresno are famous for their Red Emperor grapes. All three of these varieties of grapes are in great demand in the Eastern markets, and California has established her reputation on them, and the demand for them is still growing. The possibilities in this one line alone are beyond calculation, when fruit that is beautiful in color and exquisite in flavor can be put on the markets of the world when the Eastern fruit is well cleaned up.

In California Valley.

The whole length of the two great valleys of Central California is well adapted to the growth of canning peaches, and the quality of the California cling peach as put up in cans cannot be excelled. These peaches have been bringing prices that have made the growers rich, and the rapid increase in the acreage that has been coming into bearing in the past few years has not affected the price at all, but on the whole, there has been a steady increase in the price paid by the canners. Proper treatment and good culture has improved the quantity and quality of the product, so that the demand at high prices is a solid one and will, no doubt, always be maintained.

Greater Things Coming.

Other varieties of fruits ripen at a time when the Eastern markets are bare of fresh fruits, and with the new developments in handling fruit before and during transportation, has made fruit growing one of the most promising and attractive occupations that can be offered. The State has made much progress in growing and handling fruit during the last few years, but it is a small showing in comparison with what is now in on the eve of development.
—J. W. Mills.

The Superlative Raspberry...

Too much cannot be said in favor of the Superlative. It is a red, sweet berry three times as large as any other Raspberry, to my Knowledge. It is a continuous cropper from May to November. I counted on one cane 472 berries of different sizes. Just think of a sweet Raspberry as large as a Red Logan. Do you know what that means? It means for years to come heavy demand for fruit and plants. Every nurseryman will want a big supply. It is a stiff, upright grower and it throws its young plants from the roots called suckers. The plants should be planted in rows 3 feet apart in the row, and the rows 5 feet apart. A good mulching in the spring will help them crop heavier all summer. Plants planted now will give you a nice lot of fruit this coming summer. In order to get the true Superlative I imported 10,000 plants from the producer. I warrant my stock to be true to name. See cut of berry above. Now is the time to plant. I warrant every thing I sell. Also guarantee safe arrival of plants, and if not satisfactory on arrival, return at my expense and money will be returned at once. Also colored plate with Catalogue.

Benefit from Cover Crops

BY JAMES MILLS, RIVERSIDE.

A continuation of Mr. Mills' address from last week.

Liebig and other great scientists wrote years ago that the time was near when the nitrate supplies of the earth would be exhausted; that because of the tremendous evils, that follow our methods of cultivation the earth would be wasted, the nitrogen of the earth would be washed out and lost, and that all the sources of nitrates in Chili and elsewhere would be exhausted and man would die because fertilizers could not be found anywhere to continue the growth of plants on which he lived; and it was when they found this little micro-organism that they appreciated the fact that Nature did not leave out a link in the cycle of life. I say the mission of these little bacteria is just this. Plant life decays, plant life is growing; animal life lives upon it, animal life dies, decomposition comes in. Bacteria, through their activity, decompose them. The nitrogen that is in the plant, the nitrogen that is in the animal, goes off again into the atmosphere; and right there comes in the bacteria, working in the leguminous plants and independent of them, also, and lays hold of the free nitrogen, carries it back into the soil, there again to begin the cycle that it went through for millions and millions of years—eons upon eons of time. God, in his great wisdom and power, has not left us helpless, then, but has provided us a means to get that which we need for the life of the soil.

A Mission.

This humus has a great mission to perform. It is physical life—it gives physical life to the soil. You and I cannot do our work properly, cannot do it well, cannot do it happily, unless we are physically strong. No matter how powerful the intellect of man may be, if that powerful intellect is in a tiny, sickly body, it is unable to do the great work which the Creator intended it should do, and therefore, it becomes the duty of man everywhere to preserve this tabernacle of his soul that it may enable him to do the work given him by God, for himself and his fellows on the earth. It is true also of the soil; it must be kept physically well.

We, in this building and in our homes, need fresh air. We open the windows and the doors that the air may freely circulate and that we may have the oxygen to breathe into our lungs. It would be very bad for us if we closed down the windows and closed the doors and breathed again and again the noxious gases that we gave off through the hours of the day from the lungs. Thus, we want the air to circulate. It is true also of the soil. The soil wants aëration, it wants to be kept open so that the air may circulate in it. The roots need to breathe, the plants need to breathe; the bacteria give them the oxygen to live upon. The soil needs ventilation—that the noxious gases, poisoning the roots and poisoning the soil if it has not opportunity to get away, must have that opportunity to escape. Ventilation! And, therefore, in the soil we must work to keep up that condition of aëration and ventilation. Humus, mixed with the earth in sufficient quantities, brings about that condition. It also enables the soil to contain more water. It gives it a greater abs tive power for water.

Will Absorb and Hold Water.

You know, as I know, that growth of one ton of solid matter it whatever crop it may be, cerea fruit, requires from three hun to five hundred tons of water, wl must be pumped up by the system and root pressure and face tension from the subsoils of earth. Now, when we increase n and more the holding power of soil for water we have done a mi good thing for ourselves. Take, instance, one hundred pounds sand. It will absorb twenty pounds of water, and it will hol for about four hours. Take one l dred pounds of humus soil and it absorb one hundred and ninety pounds of water and hold it weeks. Is it not, then, the part wisdom that we so cultivate our s as to increase constantly from to year the amount of humus, in der that we may get a better aëra and better ventilation and a grea holding power of water?

I want to tell you an incident happened on a certain soil d South. There was a twenty- tract of orange grove that took immense amount of water. T we allow one inch to five inches the irrigation during the year. twenty acres took ten times water that was alloted to it, could not have been held in cult tion if it belonged to an indivi who had only the water that was longing to that twentw acres— inches of water, four to twenty, to five. Samples of the soil taken for eight feet down, ever inches of the way. They were ta to the laboratory and put under microscope, and behold what found! Piles of building s You see on the side of the road the foundation of a great build piles of stone with jagged edges spaces through which a cat may Just so was that soil, not to that ent, but under the microscope s ing like that. There was nothing gravel. That was the trouble. humus had been worked out an not been replaced. Barnyard ma was put in the soil, covered u Cover crops were sown, one a s mer crop of cow peas, the oth crop of Canadian peas, and the year this happened: They were dered not to irrigate that soil. T had been a splendid rain in the ter. The rain went down along root system, percolated deeply the soil and filled the subsoil. L month after June there was d hole ten feet deep, twelve feet and eighteen inches wide, and that the man went and examined soil, finding considerable moistur the subsoil, and, coming out, the was filled. You have got your tem; go after the water; it is th the function of your roots is to water—get it; and the water held off until October; not an ir tion; constant cultivation, how so that no loss of water would place by evaporation, but that e drop of water would go through hair root and up into the trunk through the tree to the leaf,

BUTTE COUNTY'S ORANGES.

WITH the roots of her trees in the sands which are filled with gold, is it any wonder that Butte county is producing golden fruit? Some of her orchards have even been uprooted by the great dredgers, hungry for the gold at the roots rather than at the tops o fthe trees.

But there are yet many fine producing orange ranches there. Regarding these we wrote Mr. Duncan C. McCallam of the Oroville Chamber of Commerce for information, and he sends us matter, from which we take the following:

Orange growing in Oroville dates back about the year 1867; at that time Hon. Charles F. Lott, who is still a resident of Oroville, secured seeds from the pioneer tree of Butte county growing at Bidwell's Bar, and planted them in his door yard in this city. Thrifty trees grew from this initial planting, and the seeds from them, together with further drafts on the old Bidwell Bar tree, furnished our city with the trees which now adorn nearly every yards; the crops were early, bountiful and of good quality. In 1887 Oroville oranges were placed on exhibit for the first time at a citrus fair held in Sacramento city, at which oranges from all parts of Northern and Central California were exhibited.

At about this period injunctions were obtained against hydraulic mining, which industry was at that time one of Oroville's most foremost, and that the city should recover as far as possible from its loss the citizens, determined to re-establish their prosperity by giving Oroville and vicinity every opportunity of proving herself one of the greatest citrus-fruit producing regions of California.

From this beginning there is now upward of sixteen hundred acres in and about Oroville planted to oranges.

Conditions such as surround Oroville's orange industry seem worthy of the widest exploitation. The fruit is largely marketed through the California Fruit Growers' Exchange. The local association is in splendid financial condition, each succeeding season seeing it materially strengthened in that respect. The officers and directors are: Glenn W. Miller, president; E. Tucker, vice-president; C. F. Lott, Fred H. Gray, J. F. Fitzgerald, W. H. McNamee and A. Bartlett, while the Bank of Rideout, Smith & Company, is treasurer, and Duncan C. McCallum, secretary.

The bulk of Butte county's orange crop is grown in what is known as "The Thermal Belt," a narrow strip along the base of the mountains, covering that portion of the foothills lying between altitudes of about 150 to 600 feet. The Thermalito, Wyandotte and Palermo are also strong factors in citrus production. This is especially true of Palermo, which has great possibilities for future development.

1908 INCUBATORS AND BROODERS.

One of the handsomest little catalogues we have seen relating to the poultry supplies and incubators, is one issued by the Henry Albers Co., 534 S. Main St., Los Angeles. In fact, this is the first catalogue issued since the firm has occupied its new quarters, and we presume it is, to a certain extent, due to the desire to celebrate getting into the new and larger quarters. That the book may be of such value to the poultryman as to merit keeping; it has blanks for egg records and a fund of information which will impel every poultryman to keep it on a handy hook. It is punched ready for a ribbon so that it may be placed on the same nail with the family almanac. We doubt not that it will be sent for the asking, if the Cultivator is mentioned.

CENTRAL CALIFORNIA ORANGE SECTION.

On a Sunday afternoon some months ago it was the pleasure of the writer to take a stroll out from the little city of Porterville toward the hills, and even on to one of the hills. The climb was well worth the effort, for the view of orange groves in the immediate foreground, the town farther away and the great stretch of fertile, productive San Joaquin valley off in the distance, was an inspiration.

The orange and lemon clung close to the hills, but the beautiful dark green of the trees stretched like a long ribbon both to the north and south for miles.

Lindsay is not far away to the north, which is a great producer of fine fruit. Beyond is Exeter and other good producers. Altogether, this section produces about 2500 cars of fine fruit.

Land is cheap, soil is productive, water is plentiful and a great future is promised.

We had hoped to hear from Mr. A. E. Miot, secretary of Tulare County Board of Trade, an article on the possibilities of citrus culture in Central California, but our request did not reach him in time to give him opportunity to comply.

In a short letter, however, he says:

Owing to the haste with which we have to reply to your communication we can, of course, give you only a synopsis of the condition of the citrus industry in Tulare county. The season's output of navels, which will amount to 2500 cars, (an increase of about 800 cars over last season), is now (Feb. 6th,) practically havested. The early shipments, leaving here the latter part of October and first of November, arrived in the East just at the height of the financial flurry and, of course, brought small returns, but with the rally of the market later on and the increase of the yield over last season, this season has been fairly satisfactory to the growers. The general outlook seems to be so satisfactory, that this year's planting will exceed that of last season. Last year something over 3000 acres was added to the acreage. It is estimated that 5000 acres will be planted this season. Much leveling of land and preparation for planting is now going on, and the nurserymen inform me that nursery stock is becoming exceedingly scarce. The horticultural commissioners report that the groves are in an unusually healthy condition and remarkably free from pests of any kind. There is a strong demand for land in the citrus sections, and the future outlook for the citrus industry is particularly bright.—Arthur E. Miot.

MORE POULTRY MONEY.

The Sure Hatch Incubator Company has been compelled to get out another edition of the book on "Poultry Profits" to meet the many calls for free copies that keep coming in from people all over the United States. This book contains the experience of hundreds of the most successful poultry raisers in the country. In fact, it is a complete poultry raiser's guide, adapted to the needs of the beginner as well as the one who has had considerable experience. Each of our readers should write for a copy of "Poultry Profits."

The Sure Hatch Incubator Co., Box 150, Fremont, Neb., or Dept. 150, Indianapolis, Ind., is the largest Incubator concern in this country and its "Sure Hatch" Incubators are wonderfully successful. They are built of California redwood and fitted with the most scientific hot water heating

Orchard Planting and Care

BY R. M. TEAGUE, SAN DIMAS.

THE California Cultivator has been good enough to ask me to contribute an article on the culture of the orange and lemon for its Citrus edition. This in its broad sense is rather a large subject, covering in its entirety, the soils and climates, methods of propagation and cultivation, manner of picking and finally, the harvesting and marketing of the product. For the most part these basic principles of our leading industry are pretty thoroughly understood by the owners of orange and lemon groves in this State. The side issues, such as the finding of injurious insects and diseases, the selection of proper varieties, the training and pruning of the trees have also been rather thoroughly exploited. It would seem that in the evolution of citrus fruits in California, that we have thoroughly mastered the difficulties in a way, and we have tested understand them at present, find u off the market. For instance, experi ments carried on in the Imperial val ley have demonstrated that the or ange will mature its fruit there m earlier than in Riverside and San Gabriel valley. We have a learned that in the Tulare district, the heart of this great San Joaq valley, that the orange and lem will ripen its fruit as early as t latter part of November, thus t crop harvested at that point is pr tically off the market at the time th Riverside crop is at its best. Th diversity of climate, coupled with th earlier and later periods at which fruit ripens, has suggested to me th thought that when we shall on have thoroughly exploited the possib ties of citrus culture in this State, shall learn that over a very large s son of the year the orange will found in a marketable condition

—Courtesy San Dimas Nurseries.
NURSERY TREES BALLED FOR PLANTING.

out all the inferior varieties of both oranges and lemons until we have simmered down to what are really the money making sorts. Strange as it may seem, these have been by a law of elimination reduced down to a very few kinds. In the orange, we have first the Washington navel, then the Valencia Late, Thomson's Improved navel and possibly two or three others, such as Ruby Blood, Mediterranean Sweet and the Paper Rind St. Micheal, with the Mandarin and the Kumquat as profitable novelties; in the lemon, it has simmered down to about two sorts, the Eureka and the Villa Franca.

As an economic proposition, it would seem at this time wise to attempt the improvement of these sorts; that is to say, extend the season of the Washington navel over a wider space of time, improve the shipping and eating qualities of all of these varieties as much as possible. These endeavors, it would seem to me, would lead to larger returns to the growers.

We Must Cover the Whole Year.

There is another thought, however, which has been brought forcibly to my mind the past year or two in my travels over the State. It is this, that with our great diversity of climate and soils, is it not possible that in the geographical distribution of the orange and lemon, we might find that certain varieties will come into market at just such periods of the year when the planted areas, as we one or more points.

The experiments that have be carried on of late in the Imperial v ley have impressed me with thought, namely, that there are s undeveloped citrus areas which produce a fruit which will be exc by none, at the same time com into marketable condition at s times as not to conflict with areas already in cultivation. Fi years ago, we were told that the ange culture had reached its mum, when low and behold, the lare citrus belt was exploited, c for thousands of trees and the Inv ment of large capital in its dev ment, all of which has given h some returns; while the Tulare are not by any means develope their possibilities, we learn that Imperial valley possesses all of conditions of soil and climate c lated to produce citrus fruits in chantable quantities.

Watch Us Grow.

The present crop of citrus fruit the State has been variously esti ed from twenty-five thousand twenty-seven thousand carloads believe this to be but a mere frac of what we shall eventually gro these fruits. So much for an op istical survey of the field, let us view the subject at closer range.

Basic Principles.

This, it would seem to me, is ly the place to go into a minute cription of the various proces sential to the building up of a

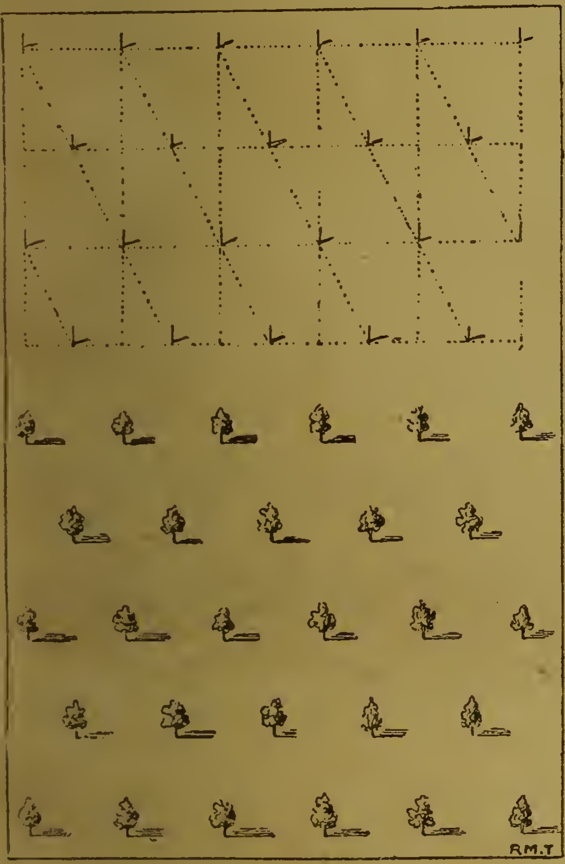
sful orchard. A few basic princi-
s, however, should not be over-
ked. It goes without saying that
citrus fruits are partial to a soil
med from disintegrated granite.
e subsoil should be fine, but still
ow water to pass through it freely.
rsely stated, it should be of a rich
mbination, with water not less than
enty-five to thirty feet from the
rface—this for trees budded to a
eet root. Trees planted on heavy
lley lands should be budded to sour
ck (Citrus Bigaradia,) or in ex-
ptional cases where the water is
se to the surface the root of Cit-
s Trifoliata can be recommended.
e surface should be of a sandy nat-
e, so as not to bake or crust after
ins or immediately following irri-
tion. A coarse, sandy surface or
en a gravely surface is not necessarily objectionable, provided that
e subsoil is right.

An altitude of from eight hundred to
xteen hundred feet along the Coast
nge is probably best, though it
ust be admitted that with the ex-
riments in the Imperial valley at a
uch lower altitude would seem to
ve at least modified, if not ex-
oded that idea.

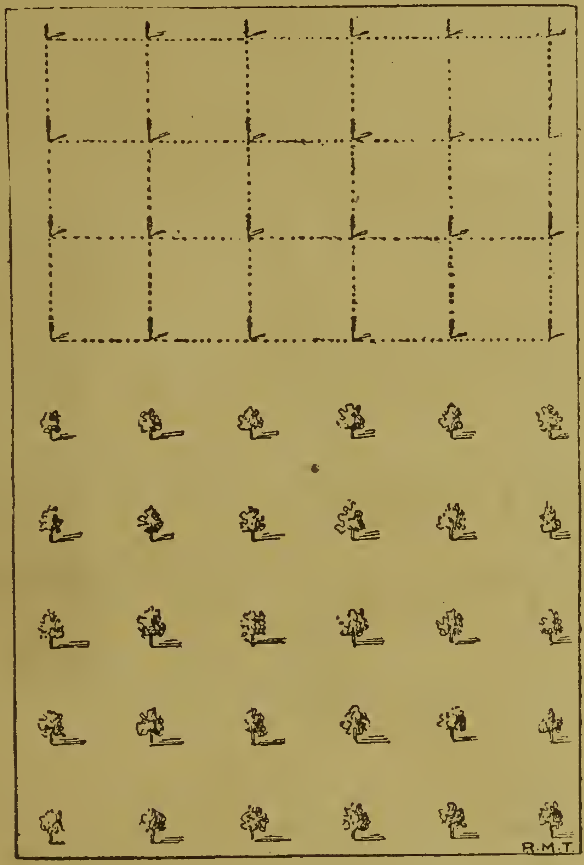
Having selected your land, ob-
ined your climate, there is still one
her essential you must not over-
ok, and that is, an abundant supply
water for irrigating. Indeed, so
perienced an authority of land and
ater in California as Theodore S.
n Dyke has laid down the axiom
find your water and then to look
r the dirt to put it on.

e Planting.

These physical conditions having
en secured, your next step will be
e preparation of the land. Need-
ss to add, it should be thoroughly
owed, cross plowed and harrowed
til every particle shall be well
mmunited and friable as an ash
ap. Of course, this being accom-
lshed and you have secured A-1
ees for planting, you will next lay
your land in straight rows by the
uare, quincunx and hexagonal
ethods, as best suits the shape and
ntour of the land to be planted.



THE TRIANGULAR SYSTEM.



TREES PLANTED ON THE SQUARE SYSTEM.

The orange, like many other evergreen trees, is keenly sensitive to the exposure of its roots; however, in handling young trees, care should be exercised to have holes already dug for their reception (it should be of sufficient size to allow the spreading of the rootlets in their natural position. The trees should be well puddled.

Take the tree, place it upright, fill in the top soil, being careful to tamp down the earth all around each of the roots, adding water at regular intervals until the entire hole shall be filled to the surface, then press down the soil rather closely, water again copiously and go to the next tree. The larger the force in carrying cn this work the better. The young trees, all planted in orchard form, the new beginner will, of course, be anxious that the same shall grow strong and (be anxious) that the trees shall begin to bear fruit at as early a date as possible. Needless to add that this condition can be greatly accelerated by intelligent care and application. No tree is more responsive to good treatment than the orange or the lemon. Careful cultivation, regular irrigation and careful watching are the factors that enter into the development of the profitable citrus grove.

Cost.

The attendant expenses vary in a general way for the preparation of the land, from fifteen to twenty-five dollars per acre. This includes cultivation for the first year. After that, however, the cost of culture will be quite apt to increase, varying according to the amount of labor expended.

If the trees have been well cared for, have been kept free from injurious insects, are exempt from disease, the orchard should pay expenses the third year from planting, by the fourth it should produce about a box of fruit to the acre, the fifth one and one half boxes to the tree, and from that time on, increase in productiveness and profit to its owner in the corresponding ratio to the amount of labor and intelligent care expended on it.

Amount of Water.

The volume of irrigating water is also very elastic, depending upon the charcater of the soil and the lay of the land. Usually the amount is about one inch to ten inches for the first two seasons, one and one-half for the two following seasons, two inches for the fifth and sixth years, after which period one inch to every four acres will be about correct. The expense of caring for an orchard is also a matter of condition and environment, if all the labor shall be hired it will obviously run up the expense, so that it is almost impossible

HOW WE GROW STRAWBERRIES.

TO MANY queries come to us for information about strawberry growing, that I have thought a brief article on the subject would interest a great many readers of the Cultivator.

It is natural that I believe our methods the best. When some one can show better results than we get, I shall be interested in learning how it has been accomplished. In twenty years' exeprience in Southern California I have learned some things about the strawberry that cost a whole lot of money and hard work.

Growing to Plant.

One of the most important things learned was that it never pays to set out plants that have been propagated from a bed that has borne fruit. We make the growing of our plants an operation entirely separate from growing fruit. Our plant beds are not allowed to bear fruit, nor are our fruiting beds allowed to grow runners. January 1st to April 1st is the best season to plant.

The Land.

We are careful to grade our land perfectlly as a beginning, then cover the entire surface with stable manure as heavily as our purse will allow, up to one hundred tons per acre. It does not matter if the manure is fresh from the stable or corral, but it must not be too coarse or full of straw. The abundant use of water prevents disastrous results from using fresh manure. Plow this in eight or nine inches deep—then sow sulphate of potash at the rate of 500 pounds per acre, and harrow two or three times or until the ground is as fine as it is possible to make it. Then go over it with a planker so as to get it smooth and in shape for marking out.

Planting.

We stretch a wire as a guide for the first row with the marker, which has four teeth 20 inches apart. As, after the first time going through, one row is used as a guide. We make three rows at a time.

The plants are set about a foot apart in the rows. This method requires 26,000 plants per acre. After the plants are set out we give the most thorough cultivation with wheel hoes—allowing no weeds to grow. Necessarily there will be some hand hoeing between the plants. We avoid irrigation as long as possible in the early part of the season, but are careful never to allow the plants to suffer for water. So much depends on the soil and the weather, so that no set rule can be given as to how often. Land and water and manure are too costly in California to practice the methods in vogue east of the Rocky Mountains, of planting wide distances (such as three feet) apart, and we have found difficulty in picking if the rows are closer than 20 inches. When it becomes necessary to irrigate, we attach a broad shovel to a wheel hoe that will make a wide furrow and not too deep. As this attachment does not come with any of the wheel hoes, we had our blacksmith make it. A furrow two to three inches deep by about eight inches wide is to be preferred to one deeper and narrower.

Two hundred feet is about the limit of the length of the rows. Something will depend on the grade. If the rows are too long, the portio next to the flume will get too muc water and the extreme end too littl After we begin to irrigate, which about the time the plants begin bear, we do very little cultivation, ex cept to keep out all weeds, which done with a common blade hoe file very sharp. From this time until th plants cease to fruit, close attentio must be given to the matter of irriga tion. On our land we usually have irrigate once a week—sometim twice.

Varieties.

We have given a fair trial to abo 35 varieties and have found th Brandywine the only variety that profitable on our soil and in our l cation. In locations having le frost, there are varieties that gi fair returns, and the only way is f each one to make tests of the diffe ent varieties and thus learn which best.

No variety seems to be so uniforr ly successful as the Brandywine, a no one in Southern California seen to bear so continuously. We se our first berries to market last seas on March 30th, and we picked eve day until the 25th of October. Th early part of the past winter w very dry and warm and there were good many berries up to the prese time. But the flavor was poor a the market glutted, so that after D cember 1st we ceased sending the to market.

In conclusion, I would emphasi the fact that it is better to lim your area of ground to the poi where you can do every portion the work at the proper time and the best manner, rather than spread over a wide space hoping save labor by using a horse cultiv tor. The irrigation problem is costly one. A man can go over acre per day with a wheel hoe.—Q. L.

A FEW THINKS.

"A Few Thinks on a Subject Wort of Serious Thought," is the title of little pamphlet issued by the Barb Asphalt Roofing Co., of Philadelph It touches on the matter of roofi and is chuck full of interesting stu

The Ornamental Garden

AMARYLLIS.

Amaryllis is a genus of deciduous lbous plants found native in South frica, consisting of a single species, . belladonna, of which there are sev-al varieties. The genus at one time cluded plants now known under the ames of Vallota, Sprekelia, Zephy-nthes and Hippeastrum, the last entioned being still included in maryllis in many garden and trade llections. Amaryllis belladonna—e Belladonna lily and its varieties—roduces its blooms without foliage uring summer and autumn, the aves develpoing after the flowers ie. The growth of foliage continues roughout the winter and spring, the liage dying and the bulbs resting uring the greater part of summer. ippeastrums are natives of Brazil nd other parts of tropical South merica, and the islands adjacent, nd vary greatly from Amaryllis in e production of their flowers, and e flowers also, which develop with e foliage during the spring and ummer, the bulb resting during win-er. Hippeastrums have been greatly nproved by horticulturists, various pecies being hybridized with success. he hybrids are far superior to the riginal types in size of flowers, ange of color and form. Sprekelia is also a native of tropical South America. The only species cultivated in our gardens is S. formosissima which bears singular but beautiful flowers of a bright crimson color. Vallota purpurea, a native of South Africa, flowers during autumn, and is one of the most beautiful of bulbous plants, the blooms being large, cup-shaped, and of a brilliant scarlet shade of color. Zephyranthes are small, bulbous plants producing white and pink flowers. The whole of these are hardy plants in the greater part of this State, and may be grown successfully in most of our gardens.

Culture.

Amaryllis belladonna is probably the hardiest bulbous plant cultivated in Victoria. It requires an open position and good drainage, and under such conditions it will thrive in most soils with a minimum of attention. It is a splendid subject for large dry borders, producing its delicate pink flowers, which are borne in umbels on long, stiff stems, freely for several years without special assistance. Bulbs should be planted during summer at a depth of about six inches below the surface in unmanured soil. They are most effective when planted in patches containing many bulbs, which should not be disturbed for several years except for the purpose of increase which is effected by offsets from the large bulbs. The bulbs should be planted sufficiently apart to provide for increase, about six inches being enough. There are several fine forms of the belladonna lily including A. blanda and Baptisti, white; magnifica, major, rubra, multiflora and purpuprea, of various shades of rose and purple. These are scarce, and fairly expensive, and usually receive much more care and attention than the ordinary type, though requiring practically the same treatment.

Hippeastrums are magnificent plants for the borders, requiring a sunny position and well drained soil of rather light texture. Unless the soil is very poor no manure is needed, and even in poor sandy soils an admixture of clay or strong loam is preferable. If manure is added to the soil it should be thoroughly decayed cow manure, and should not come into contact with the bulbs. Planting should take place during late autumn or winter, the proper depth to plant being that occupied by the bulbs before removal, viz.:—The crown or neck of the bulb showing at the level of the surface. Hippeastrums require fairly moist conditions during the season of active growth, and as little water as possible when at rest. They are admirable subjects for pot culture, some fine specimens being occasionally seen at horticultural meetings. An evergreen species H. reticulatum bears foliage striped with white in the center, and flowers of shades of pink. Several fine hybrids have been raised between this and other species, retaining most of the characteristics of reticulatum. In most of the local nursery and seed catalogues hippeastrums are referred to as Amaryllis hybrids, some of the finest varieties being comparatively rare and expensive.

Vallota purpurea requires almost identical treatment with hippeastrums, and is specially suited for pot culture. Several bulbs should be grown in a fairly large pot in well drained loamy soil. They should remain undisturbed until the pot becomes too small owing to the increase of bulbs. Over-potting and disturbance are the most general causes of their failure to bloom. The soil should never be allowed to become dry. Bulbs of vallota are plentiful and fairly cheap.

Zephyranthes require a moister situation than the hippeastrums, otherwise the culture is practically identical. Z. carinata is one of the best kinds.—Journal of Agriculture of Victoria.

Peaches, Climax, Wickson and Kelsey Plums, and Hungarian Prune
THESE STANDARD MONEY MAKERS ARE GOING FAST

Note the Fine Assortment We Offer

You never buy a cheap horse and expect to get a good one. Some fruit ranchers buy the cheapest tree they can get, but an orchardist—never. Our trees and vines are not the cheapest, but they are the best that **Care in Selection** and growing can produce. We propagate only from parent trees and vines that are the best specimens of their kind, and our stock will give you good service for a lifetime. That is what you want.

Bees and Their Care

OF INTEREST TO BEEMEN.

Among the many industries that are making use of the resources of the national forests is that of beekeeping, says a late Washington dispatch. In the Santa Barbara forest of Southern California there are 40 apiaries under government permit. One permittee in this forest has averaged nearly 40 tons or honey in the last three years. Outside the boundaries of the forest beekeepers have to pay for an apiary site five or six times the charge made by the forest service.

Right here we want to call attention to the benefits accruing to beemen by reason of having the government own and control these forests. Note the fact that they must pay five and six times the charge made by the government for a site outside the forest boundaries. Government ownership and control of other natural resources, and of public utilities, would be just as economical for the people. Ponder on that, and see if you can't use your vote to bring it about.

Since bees do not in any way injure the forest, this idustry is welcomed by the forest service, which seeks at all times to secure largest utilization of national forest rerources. The interests of the service and the apiarists are peculiarly identical, because whatever would damage the forest would detract also from its honey producing capacity. The beekeeper, therefore, is alert to detect and extinguish fires and to report to the forest officers the appearance of any other element of danger to the welfare of the forest.

Inquiry regarding the suitability of a forest for bees or application for an apiary site should be addressed to the supervisor of the forest in which a location is desired.—Escondido Times.

NOTES ON BEEKEEPING.

Persons of irregular habits, afraid of too much work, careless or unkind, would better not undertake the bee business, or handling live things of any kind.

Let no man undertake beekeeping thinking that it is an easy task. Beekeeping is like growing a crop. It takes care and labor to make it succeed.

There are still some who argue that the most money for them is in old ideas, old methods and common bees. They regard the new as too expensive. The best beekeepers and those who make the most money use up-to-date methods.

Those who are in the bee business because there is money in it are not as apt to succeed as those who are in also because they are fond of bees and their care. It takes a fondness for a business to obtain its best success.

Since the coming of alfalfa, any section of the country where it is grown to good advantage, is well adapted to beekeeping. Beekeepers say that each colony ought to average from $3.00 to $5.00 worth of honey every year besides the swarms which come off.

Some localities are very much better for honey than others. Southern California and Southern Texas are among the best countries in the world. Intelligence, industry and a good location are necessary to the best results.

Bees and insects are exceeding interesting and useful in carryi pollen from flower to another of t same species. The busy insects see made for each other. They are aft food to eat and nectar for wint food. While hunting these, a lar number of flowers are visited and t fertilizing pollen distributed.

California has the name of be one of the greatest bee countries the world. It is a land of fruits a flowers, giving bees, blossoms a shade. In 1857 the bee industry w commenced there. Honey sold at and $2 per pound and bees as high $100 a swarm. Now there is a go business carried on there, wi honey at six cents a pound and be at $3 a swarm.—W. F. Morgan, Inland Farmer.

DESTROY THE DODDER.

Dodder, a rootless parasite, cal "love and tangle," is damaging so alfalfa and clover fields. It wra itself around a plant as tightly could be done with flax tow, smot ers it and leaves it a dead and bla mass, making a desert in an oas We have not learned the prescrib method of fighting such an en but tearing it loose and to p with a rake certainly kills it. T dodder has a center and works in circle. It accounts for the bare spo in grass fields. It will probably k any kind of a plant. A leaflet issu in Great Britain says:

The question to what extent t various species of dodder are har ful to agricultural crops is o which is of considerable interest the farming community, and f some years past the agricultur press has contained many referenc to the prevalence of the pest in v rious districts.

Moreover, in 1905, as much as per cent of the clover seed sam examined by the botanist to Royal Agricultural Society w condemned owing to the presence dodder seeds, while two samples red clover contained no less than s per cent. Some information, the fore, on the several species of d der, the methods by which they a spread, and the best means by whi they may be suppressed or avoide may at the present time be of va to agriculturists and seed mercha alike.

Various suggestions are made f prevention and remedy. Am these it is pointed out that wh dodder is found infesting a cro however small the patch, s should be taken at once to dest it. This may best be done by d ging up the infested plants a burning the whole, in situ, by c ering the area six to nine inch thick with long chaff, spinkling with a paraffin, and then firing i

Tearing out the dodder with rake is to be condemned, as this e serves to spread the evil. Inf clover or lucerne should not be to stock, as the seeds pass thro the alimentary canal unaffected. Frank mentions a case in which field was actually infected by m of manure from young cattle. cases where the infestation is ve extensive, covering the larger part the crop, it is perhaps better plough the whole under before see are formed. Attention was called 1904 to the value of calcium sulph as a means of combating dodder an other parasites, and experimen show that this substance is ve clearly superior to sulphate of ir It should be applied in the form a powder when the dew is on t leaf. Above all, good cultivation the widest sense should prevail, an all fields, hedges and ditches shou be kept clean and free from weed Coleman's Rural

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

tock for Oranges.

Is the trifoliata orange root or tock a success? Does it stand more rost than other roots? Are navel nd other oranges on trifoliata roots s good, sweet, prolific, etc., as other tocks? What are the relative merits f the Florida sour and the California r Tahiti sweet roots?—F. E. B., akeview.

As a rule, planters seem to prefer ther roots than the trifoliata, though here are many thousands, of course, lanted on that root. Some men are ery partial to the trifoliata, maintaining that it is more frost resistant, ut this is denied by many who have bserved it in orchards along side of rees budded on sweet roots. We hink the general opinion is that here is no difference in the quality f the fruit grown on the two roots. The relative merits of the California weet and the Florida sour will depend largely on soil conditions. In a light, warm soil, the sweet root is argely preferred, but on the heavier, noist lands foot-rot or gum disease s so bad that the sour root is usually preferred.

Black Knot.

Is there any cure for black knot on rees?—N. P. M., Gilroy.

The best cure is to prevent its spread by cutting off such excrescences and burning. Use tools that are disinfected in a strong solution of corrosive sublimate. We suppose that you refer to knots on the branches.

Eucalyptus at Imperial.

A non-resident land owner in Imperial valley will appreciate an expert opinion upon the cost of planting eucalyptus per acre and the care necessary, with the number of years to wait for returns.—J. O. C., Hollywood.

Eucalyptus trees should be planted in six-foot squares in the Imperial valley where the water is cheap and easy to apply and with such rich soil. The cost of the trees will depend upon the market. Perhaps $1.50 to $2.00 per 100. Cultivation would cost about $2.00 an acre for the first two years and after that the only expense will be water and its application.

Five years would give you timber that would give about 3000 posts and an indefinite amount of stovewood per acre. These figures are based on the Red Gum, Eucalyptus Rostrata, as we know it there.—J. W. M.

Sick Orange Trees.

I have a number of large "Mediterranean Sweet" orange trees which do not bear well. They set a large crop last year, but nearly all dropped in June. The trees are a little yellow, but made a good growth this year. Would "Pure Blood" make a good fertilizer for them? A neighbor told me that they were "bark bound" and advised me to split the bark on the stock; he told of a number of cases of trees treated that way which bore well afterward. Having never heard of this method, I should like to have your opinion on the matter.—A. G. D., Redlands.

Dried blood is a good fertilizer for trees that are not in good color, but we would prefer to give them a good dressing of complete fertilizer with an addition of about two pounds of blood per tree. About the first of March or even now, if you have already fertilized with complette fertilizer, a pound of nitrate of soda per tree will help. If you are soon to apply fertilizer, we would advise putting on one which has some nitrate of soda in it.

Slitting the bark of your trees will not injure them, and in many cases will benefit them, especially if the bark becomes hard and tight.—J. W. M.

Vines and Olives.

I am going to put out 29 acres to Malaga vines and wish to use a border; would the Mission or Manzanillo olive pay as well as figs? Which of these varieties would be best? Will olives grow in alkali land as well as figs would?—M. R. P., Kerman.

If you desire ease in handling fruit, you had better plant figs, and as they have proven as profitable as olives, we prefer them.

Olives prefer a well drained soil, as do figs. We would prefer figs in your case.

Loquats and Persimmons.

Why are loquats so often barren? Upon what root stock are persimmons usually grafted and what is the best all around variety of Japanese persimmon? Is there any scheme to make large, thrifty Royal Anne cherry trees bear? Would mixing them with other varieties bring them into bearing?—J. Q. D., Corralitos.

Loquats are often barren because they are usualy grown from seeds. If you want to grow loquat trees that you can count on bearing, you must graft some well known bearing variety onto your loquat or on a quince.

Persimmons are usualy grafted on their own root; that is, Japanese varieties are grafted on Japanese seedlings. The wild persimmon that is a native of the Eastern States is a rapid grower, but sends up numerous suckers that are a nuisance.

We doubt if you can make Royal Anne cherry trees bear fruit in your section. That variety of cherry will not bear unless the climatic and soil conditions are just right. There are but a few places where that variety does well.—J. W. M.

Oranges from Seed.

Would like some information on growing oranges from seed. Would like to know which grows the best plants, sour oranges or sweet. Would also like to know what kind of a seed bed is necessary to plant seed in.—Subscriber, Brawley.

Crush the fruit and work the pulp free from the seed through a coarse screen. Sweet seedlings, pomelo, trifoliata or sour seed may be used. Mr. Mills will discuss merits of the various stocks later. If on heavy or damp soil, the sour seedlings are best. In your section, we imagine the ordinary sweet seedlings would be satisfactory.

Regarding planting the seed, we quote from Teagues' Citrus Fruits:

"The best season in the year for planting orange seed is in the early spring months, much depending on the season; preferably from March to May. If the soil is cold the seed is apt to decay in the ground before germinating.

In preparing the seed bed for the seed, the ground should be well plowed or forked up to depth of at

Fancher Creek Nurseries (Inc.)

Geo. C. Roeding, Pres. and Mgr.

P. O. Box 12, Fresno, California

least twelve inches, leaving the soil as loose as possible. After preparing the land in this manner, it is necessary to erect a lath house of sufficient size to cover the ground to be used for a bed, or to cover same over with burlap or light cloth of some kind. In erecting the lath house, it is best to use common plaster laths, nailing them on 1x3 battons with space left between each lath the width of the lath. In this manner the ground is half shaded, which is sufficient for the protection of the plants after they begin to grow. If it is undesirable to go to the expense of a lath house, the bed can be successfully covered at much less expense by putting up stakes at intervals and stretching wires on them. On these wires should be strung strips of burlap or light cloth. This protects the young plants from the sun.

"There are two methods of sowing the seed, the first being by broadcasting. After the seed is scattered, it should be covered to a depth of about one inch with sand which has been thoroughly screened before using. It is also a good plan to first cover the seed with about its own thickness of fine soil before applying the sand. This will insure the seed being moist at all times and will greatlly help in the germinating process. In the following the above method of planting it is necessary to sow the seed in beds, leaving small walks of sufficient width so a man can go through to spray properly when necessary with a garden hose, and without damage to the plants. The second method of sowing the seed is in drills of from eight to twelve inches wide, leaving about a six to eight inch space between each drill for the running of water in irrigating. Seed sown in this manner will grow stockier plants, as a rule, than by the broad-cast method in beds. However, it takes up more room for a bed of an equal number of plants than by the broad-cast method. After the seed is planted it is necessary to keep it sufficiently watered for the germinating and starting of plants, but not an excessive amount of water. If too much water is used, it is apt to decay the seed in the ground.

"If the bed has been properly cared for and the season favorable, the plants should be ready for removing to the nursery the following season, or one year from the time the seed is planted, though if desirable they can be carried two years in the bed before being removed and with good success. Where the removing of the plants from seed bed to nursery can be delayed, it is best to leave them two years, as the stocks vary in size. If desirable, the larger plants can be removed from the bed the first year from the seed, and the small ones left in the bed another season. As the remainder will then be thinned to some extent, the plants remaining in the bed will do much better and make good, stocky plants at the end of the second year."

Graft Winter Nellis.

I have a winter Nellis pear on the back part of a city lot that blooms, but does not bear fruit. I wish to know variety to get to plant near it so it will fertilize and bear fruit. There is a Bartlett about one hundred feet away, but blooms later. Please name two or three varieties.—H. S.

We would advise you to graft your winter Nellis to some other variety, as it is a very shy bearer in the interior valleys. We had it growing and blooming with about twenty varieties in a close proximity at Pomona and never got a crop. There was an apiary just over the fence so that there was no lack of pollination. We would advise you to graft your tree to Patrick Barry. This is a very fine winter pear.

Frost Prevention.

Can almond growers use smudges to prevent a killing frost, also is there any known remedy to eradicate linnets which are so destructive to almond buds? J. A. C., Modesto.

You will accomplish but little with the smudge, but possibly may by the use of baskets or pots which are used to make a good hot fire. It will require about 15 to 25 to the acre and if the whole neighborhood unites may be fairly successful.

Regarding the linnets it is a hard proposition although they have been destroyed by the thousands by using poisoned water or phosphorous on wheat or other poisoned wheat. A small boy with a gun in the orchard will do some good, but that method is usually too expensive. The worst feature of the poison is that mockers and many other innocent birds are destroyed with the linnets. Pieces of bright tin hung in trees so as to flutter in the wind are claimed to be of some value.

Figs and Vines.

What kind of grapes and figs are most profitable to plant in Turlock district, also olives. Would also appreciate information on keeping of sweet potatoes?

See Mr. Mills answers to similar queries in a recent issue of the Cultivator and his article in this week's issue.

As to olives we imagine figs would be better in your section, but believe that if olives are planted that the Mission or the larger varieties to be the best there is grown.

As to keeping of sweet potatoes we will ask Mr. Lobingier to answer that later.

Nitrate of Soda.

In your last issue you refer to Nitrate of Soda which I have tried to secure here, but am unable to do so though the dealers tell me that potash is just as good. Where can I secure it? M. L. M., San Diego.

Two advertisers in the Cultivator are surely able to supply you if local dealers do not. They are the Balfour Guthrie Company of Los Angeles and R. A. Holcombe, 50 Clay street, San Francisco. The dealer who would tell you that potash would in any way take the place of nitrate of soda, is certainly a peculiar dealer. They are in no way alike, though, of course, both are fertilizers. The potash might greatly benefit your crops, but if you wish nitrate of soda, potash does not fill the place in any sense. The complete fertilizer, of course, contains nitrogen, though not to the extent which the nitrate of soda does.

Insect on Vines.

A subscriber recently wrote regarding a small brown insect infesting vineyards in Sonoma county. The letter was forwarded to the State University, which is answered by H. J. Quayle in the following letter, but as the original letter is not returned, we do not have the writer's name:

In the absence of Prof. Woodworth, I am replying to your letter of the 4th in reference to a pest attacking the buds of grapevines in the Sonoma Valley. Last year Prof. Bioletti of this station reported such an insect as doing considerable damage in some parts of this valley, but he was totally unfamiliar with the insect, and, so far as our experience goes, we are not sure as to just what it may be. Judging from the description, it would seem to be some sort of a fly, but we have no record of such an insect attacking the grape in this State. The only other thing which it might be is the flea beetle, and most growers are familiar with these insects.

Last year I made some study of grape pests in the San Joaquin Valley, which is summed up in bulletin No. 192, but I did not come across such a pest in that part of the State.

I am especially anxious to investigate this trouble, however, and shall endeavor to get up into the Sonoma Valley and finding out exactly what it is. There is nothing which I can suggest that might be a satisfactory control measure.

Sulphur and Lime on Roses.

Kindly advise me as to whether it will be safe to put sulphur, lime and salt on rose bushes to remove scale and moss. M. K.

It is perfectly safe to use the s. l. and s. wash on the roses, provided they are perfectly dormant, but it would be safer to use on the trunks which are affected a caustic soda or potash solution, say about one pound of either to six gallons of water. Of course, this should not be put on young, tender growth.

Tallow Tree.

Kindly inform me if the tallow tree (Sapium sebiferum) is cultivated in California, or can be introduced. It occurs to the writer that this tree possesses properties which would make it an exceedingly profitable addition to our flora.—M. W. I., The Palms.

We are informed that the tree has been introduced into California and is a very handsome tree, though of not enough importance to encourage extensive planting.

Bichloride for Seed Potatoes.

Please inform me how much bichloride of mercury to the gallon of water for dipping potatoes is best for preventing scab. J. B. S., Encinitas.

The bichloride of mercury is probably the best preventive of scab and it is used successfully to treat potato tubers for rot and blight as well. Immerse tubers from 1½ to 2 hours in solution of one ounce corrosive sublimate, to 6 gallons of water, then plant in disease free soil.

Muscovys.

Please give me your opinion of the Muscovy duck. Is the Muscovy the same as the Mallard duck? Several poultrymen say there is no market for the Muscovy duck. What do you think of getting a start of the Muscovy ducks? I have a few, but if they are not profitable, I do not care to go into the business further.—Mrs. D. W. P.

See leading article this issue for answer.

Will you please give us some information about hatching duck eggs in an incubator (hot water) and oblige. —F. H.

See answer in Mr. Ironmonger's article this issue.

A QUEEN.

Many of our readers will be glad to know that Anna P. Williams has taken the agency for the Queen Incubator. The Queen is a good machine and is in good hands, as Mrs Williams is a thorough incubator woman and understands artificial incubation. Those interested should write her for her book No. 6. She is located at 440 San Fernando Bldg., corner 4th and Main, Los Angeles,

I·H·C GASOLINE ENGINES

Are solving the hired help problem for hundreds of farmers.

Vertical Engines made in 2 and 3-Horse Power.
Horizontal Engines (Portable and Stationary) made in 4, 6, 8, 10, 12, 15 and 20-Horse Power.
Air Cooled Engines, 1-Horse Power.
Traction Engines, 10, 12, 15 and 20-Horse Power.
Also sawing, spraying and pumping outfits.

YOU offer high wages, and still find it difficult to get hired men. Why not do as other progressive farmers are doing—let one of the dependable and ever ready I. H. C. gasoline engines be your hired man?

Suppose you want to grind feed, pump water, operate the churn, grindstone, fanning mill, separator, bone cutter, or saw wood. With an I. H. C. engine you will need no extra help. You can run the engine and attend to the machine yourself.

In the same way it can be used too for irrigating—pumping from wells, lakes, ponds and running streams. The operator can handle the head of water in the field and also attend to the engine.

The engine will work for you indoors or out, in wet or dry, hot or cold weather. You will have no difficulty in operating or controlling it.

Only a few cents per hour is required for fuel. All I. H. C. engines use either gas, gasoline or denatured alcohol.

Please notice in the above list of styles and sizes that there is an I. H. C. gasoline engine adapted to practically every farm requirement.

You can have a small engine which you can easily move from place to place, as your work requires, or you can have a larger engine for stationary use. The efficiency of all I. H. C. engines is well known. You cannot possibly have any better guarantee of a dependable engine than one of these engines affords.

Call on the International local agent for catalogs, and inspect these engines. Write nearest branch house for colored hanger and booklet on "Development of Power."

FENCE POSTS MADE DURABLE.

Fence posts of many kinds of cheap woods which ordinarily would soon decay if set in the ground can be made to last for twenty years by a simple treatment with creosote. Most of the so-called "inferior" woods are well adapted to the treatment, and this is especially true of cottonwood, aspen, willow, sycamore, low-grade pines and some of the gums. When properly treated, these woods outlast untreated cedar and oak, which are becoming too scarce and too much in demand for other uses to allow of their meeting the demand for fence posts.

Impregnation with creosote has been greatly cheapened by the introduction of the "open tank," which can be installed at a cost of from $30 to $45, or much less if an old boiler is used. A tank with a bottom 12 square feet in area will suffice for treating 40 or 50 6-inch posts a day, or double this number when two runs per day can be made. The absorption of creosote per post is about as follows: Eucalyptus, one-tenth gallon; willow, two-tenths gallon; sassafras, ash, hickory, red oak, water oak, elm and maple, four-tenths gallon; Douglas fir, quaking aspen and black walnut, six-tenths gallon; sycamore, cottonwood and lodgepole pine, seven-tenths gallon. The price of creosote is about 10 cents per gallon in the East and Middle West, 16 cents per gallon on the Pacific coast, and 27 cents per gallon in the Rocky Mountain States. The cost of treating a post will, therefore, vary from 4 to 15 cents. Properly treated, it should give service for at least twenty years.

Experiments of the Forest Service show that with preservative treatment the durability of lodgepole pine in Idaho is increased sixteen years. The cost of cresote is there relatively high, yet by treating posts there is a saving, with interest at 6 per cent, of 2 cents per post yearly. More important than the saving, however, is the fact that through preservative treatment other woods are fitted to take the place of cedar, of which the supplly is rapidly becoming exhausted. A detailed description of experiments in preserving fence posts, together with practical suggestions for treating them on a commercial scale, are contained in Circular 117 of the Forest Service. This publication can be obtained upon application to the Forester at Washington.

THE VALUE OF FARM SCALES.

I want my fellow readers to know my opinion of the value of wagon and stock scales for the average farmer. I have been using scales for two years on my farm. Since I bought them I have been able to know just what I am doing, writes Marco F. Payne in the Northwestern Agriculturist.

I am located five miles from market. When I have anything to sell it is first weighed at home, then, if it is necessary to be weighed in town, I know about what it will weigh at market by allowing for shrinkage. I know that I have lost enough on stock and grain, before owning the scales, to pay for several pairs of scales. We don't have to guess the weight of stock with our stock buyers. We farmers who do not see very much stock weighed can't guess with the buyer who is weighing every day.

In husking corn we pay by the bushel. We used to guess at the amount, but now we weigh every load, and the men have no chance to haul in a full load when I am there to see it, and then when I am away, slip in with small load.

When getting my winter's supply of coal, the owner of the coal bank (who has no scales) tells me to do my own weighing at home.

It is the same at threshing time. We weigh our grain instead of trusting to the weigher of the threshing machine.

I think that a pair of scales will pay a larger per cent on the money invested than on any other piece of machinery on the farm.

DIVERSIFIED FARMING.

The Imperial Standard, in speaking of the possibilities of that section recently, said:

It is doubtful if the farmers of any country ever had such confusion growing out of successes as is presented in this valley.

At Brawley the farmers think the farmers of the remainder of the valley are slow going because they do not engage in cantaloupe picking.

Those who have gone into the grape business wonder why it is that all the farmers of the valley are not planting vineyards.

Dairymen, into whose hands the coin of the realm is falling regularly each month in a way to bring smiles to their faces, are coming to look with a little contempt on others who can do nothing better than grow cantaloupes or grapes or raise live stock.

"It's just like finding money," says the man who raises hogs.

"It's easier than being a remittance man and getting money from home," says the man who is raising cattle.

"Values never piled up so fast as they do in raising horses," says the man who is engaged in that business.

"Sheep the best yet," says the sheep owner.

UTOPIA VS. CHINA.

The lesson taught by China should be learned and never forgotten. In these days of evolution philosophy we are prone to assume that time only, coupled with industry, will bear us, as a nation, forward irresistly toward a state closely approximating the ideal. We habitually look at the past through the large end of the telescope and at the future through the small end. We do not reflect that a crescendo movement may be followed by a diminuendo.

But look at China. Unquestionably she has been great and powerful; otherwise, she could not, as an undivided nation, have survived to her present prodigious age. Yet few would argue that her progress has brought her to approximate national perfection, and the hope that she may even yet approach such a state is dampened by inquiry into the facts of her economic life.

In Northern China, especially the mountains, from base to summit, have been swept as bare of forests as are our city pavements. In consequence, they have been gashed and gullied by fierce torrents. Floods have devastated the valleys. Wood

Healthy Chickens
A high or low death rate is usually the difference between successful and unsuccessful poultry raising.
REX Flintkote ROOFING is used for roofs and sidings on profitable poultry plants, because it keeps the houses warm and dry, with even temperature and humidity.
As a result, fewer chickens are lost and the layers are more productive in poultry houses covered with

as become so rare as to be confined rgely to the making of coffins, for hich purpose it is borne on human acks down rugged slopes and de- ies in journeys of sometimes ten ays or two weeks. Fagots for fuel re a luxury of the rich. Grass, dug p by the roots from remote moun- ins, and stubble raked clean from arvested fields, constitute the chief rms of fuel. Farming is done on ountain sides on which soil brought y flood waters or human hands, is eld in terraces by stone walls, labor- usly constructed. Rivers go dry in mmer. Areas of their empty beds e then fenced in. Soil is caught in ese when the river is full again d, on the recession of the water, is led.

Little wonder that such a land is e prey of famine, that the traveler sses through successive villages solutely destitute of human inhabi- nts; and that, even in the more vored regions, the parent upon e birth of a female child frequent- debates whether to drown it out- ght or leave it to be carried away the next famine.

Let those who have hugged to emselves the delusion that time one, combined with industrial, activ- on present lines, will inevitably nvert our land into an earthly radise; and that such earnest rnings as those, for example, of e President in his message, are t the wailings of Cassandra. look China—and think.—Forestry and igation.

URE WATER ON THE FARM.

Absolutely pure water is not to be nd in nature. The amount and e nature of the impurities vary dely, depending upon the source of pply and other conditions. Nor e all of these impurities harmful a water intended for domestic use nd very few of them may be,) but ing to the fact that water may be agent for spreading certain dis- ses, it is essential that care be en to get a supply that is free m harmful constituents.

mpurities may either be dissolved the water or carried in supension it; and they may be of animal, getable, or mineral origin. Hard- ss in water is due to the presence compounds of lime or magnesia. n may be present in quantities ge enough to make a water unfit laundry purposes.

Th greatest danger to which a me[illegible] supply is subject, however, th possibility of contamination decaying animal matter and stes. Typhoid fever and other eases result from such contami- ion. It is, therefore, important t any source of supply should be rded. In those cases where the ter comes down as rain and is ght upon roofs, to be carried to a tern, the first part of the rainfall uld be wasted, as it is full of t from the roof. Brick filters in terns are not so efficient as they generally supposed to be.

Vhen the water is drawn from a ll and comes up cool, clear and rkling, it is very difficult to con- ce any one that it is possible for thing injurious to be present, but h is sometimes the case. No well spring should be used which is ated within several hundred feet a barnyard and in lower ground. barnyard filth will find its way neath the surface of the ground, l flow for some distance before it omes harmless. What is said of ls is also true of springs. They may appear to come out of the solid rock, but there is a crevice in which they flow and there may be other crevices which will permit the entrance of the death-dealing sewage.

The examination of a sample of water to determine its goodness or its badness for any use is possible only to those who are specially fitted for that work, so reliance must be placed principally in doing away with all visible sources of harm. If analysis are desired, they may be made by the chemists of the Experiment Station of the State Agricultural College, Fort Collins, Colo.—Robert W. Gay, Associate Professor of Civil Engineering, State Agricultural College, Colorado.

HOW TO TAN SKINS WITH THE HAIR ON.

To tan hides with the hair on take a slab six or eight feet long, put two legs in one end, the other end to rest on the ground. Take a piece of an old scythe about two feet long with blunt edge; thus you have beam and beaming knife. As soon as skins are taken off trim off legs and head and scrape off all fat and flesh.

Then take four parts salt, two parts alum, one part saltpeter, one part Glauber salts, pulverize and mix; rub on flesh side of skin, fold together, lay in a cool place four or five days, then apply if necessary, which you can tell if it is all absorbed by the skin. When tanned, spread out in the shade to dry.

When partly dry beam thoroughly and when dry finish with sand paper or pumice stone. Give the hair a good brushing, as it is much better than washing. I have tanned all kinds of furs and skins, everything from a moleskin to a dogskin.

SETTLERS ANXIOUS.

There is very considerable anxiety manifested by certain holders of lands in the Imperial valley lest their right to the lands on which they have located may be challenged by the government.

This anxiety does not reach those who secured their holding in the regular way, through the general land office, but applies to those only who secured their land by purchase from fraudulent claimants. It has developed, in many cases of illegal filings, that innocent purchasers have titles which overlap those of legal claimants. All such claims are in suspension and will remain so until the government land office has decided upon the validity of their filings.

The trouble seems to come from a system of "get rich quick" operations by which insecure filings were made and afterward sold to innocent purchasers. Now that the time has come to make final proof the settlers cannot do it. There are several thousand in this fix at the present time. After having worked and improved their lands for years they find that by a system of figures used, in maps prepared by private parties, a great many claims lap over into government lands set apart as school lands.

Of course, the government can exercise its prerogative and save the settlers their lands, as they have done, in certain cases heretofore, but whether it will do so or not remains to be seen. In order to make proper and adequate defense against the contests filed, ranchers of the valley are organizing for mutual interests. The proposition is an assessment one, the general fund to be used in defending individual cases.

The defense of one claim costs more than $1000, and this expenditure, forced upon many settlers, would bankrupt them. Therefore, the mutual organization is placing a small assessment upon each member—it will amount to about 5 cents an acre—and this fund will be used for all defense, no matter where the contests may strike.

STUPENDOUS AGRICULTURAL GROWTH.

The United States presents a marvelous development of wealth agriculturally, when its resources are considered, as made in the reports for 1907.

For instance, the beet sugar industry reached the enormous figure of 500,000 tons and it may be considered as really in its infancy. It is, in fact, but about fifteen years since sugar beets were grown extensively as a source of revenue. Considering the rapidity with which the industry has extended it is little short of a wonder that it should reach the figure it has in so short a time.

In 1892 the beet sugar factories turned out 13,460 short tons of refined sugar; in 1897, five years later, 45,246 tons; in 1902, at the end of another five-year period, 218,405 tons; and in 1907 the product reached 500,000 tons.

So profitably has the business grown that the lands on which sugar beets have been successfully raised, have also increased in value adding approximately many thousands of dollars to the wealth of the country.

Another source of vast wealth lies in alfalfa. We have really no idea of capacity of this wealth-producing plant. While it is confined to the West mainly, the South is taking up its culture and the irrigated sections of the Middle West also, and the fact is as certain as anything we may anticipate that alfalfa production will be promoted, from this time forward, with far greater results than have been secured in the past. When we consider that the total crop of alfalfa hay in 1901 is estimated to be worth $100,000,000 we have some idea of the extent of its use as a hay and forage plant. And when we consider its adaptability to every class of stock, horses, hogs, cattle, sheep and poultry, and when we reflect that experiments show it to be a valuable food for man even, what may we not anticipate for this individual crop when viewed in the light of results obtained in 1907. The basis of wealth in animal industry is our forage and hay crops and alfalfa seems to be the one factor which must solve this problem.

In this connection note the advance the country has made along the line of animal industry. The farmer depends not alone on his field crops. He produces meat animals; he keeps diary cows; he raises sheep for mutton and for wool; he raises horses and mules; he keeps poultry. The animals sold from farms and those slaughtered on them in 1907 were worth about $1,270,000,000, ,or nearly twice as much as the cotton crop.

The dairy products of the country alone were worth nearly $800,000,000 in 1907, or much more than any crop save corn. Prices of both butter and milk have advanced.

The poultry and egg products for 1907 should be estimated at more than $600,000,000 in value. In fact, these products were worth more than the wheat crop. In 1899 the farm price of eggs averaged a trifle over 11 cents per dozen; in 1907 it was over 18 cents. Dressed poultry sold in New York in 1899 for 10 3-4 cents a pound; in 1907 for nearly 15 cents. So we note that animal industry has kept a sharp advance along with the basis of our general agricultural wealth, which is the wheat crop.

The wheat crop of 1907 was 625,576,000 bushels, valued at $500,000,000.

The Cultivator reviewed at length the annual report of the Secretary of Agriculture when it appeared in December, and we have no intention of repeating now what we published at the time the report was analysed, except to remind our readers of one fact, viz: that the country is developing at a tremendous rate and that the farm products of the United States last year reached the colossal figure of $7,412,000,000, the greatest in our history, and that during the fiscal year 1907 the exports of farm products exceeded the imports by $444,0000,000 a balance that has been exceeded but four times—in 1898, 1899, 1901 and 1902.

DRY FARMING CONGRESS.

The "dry-farming congress" held in Sal Lake City recently was noted for one thing: It closed with an attendance of 300 delegates more than it opened with, which is something unusual If we may predicate this fact to any one thing, it is the growing interest taken in the subject by States needing the amplification of the system.

The Salt Lake meeting was not specially noted for the promulgation of new ideas, it got down t something like a tangible organization in the se lection of a permanent secretary, whose work shall be to promote interest in future meetings and furnish information, through a bureau, t those desiring knowledge in the science of dr farming.

The congress also asked for a law increasin the acreage in the arid region from 160 to 32 acres; the boring of experimental wells by Stat appropriation and the establishment of a greate number of experimental farms.

NATIONAL IRRIGATION CONGRESS.

The 16th National Irrigational Congress wil be held at Albuquerque Sept 29th—Oct. 3rd. of thi year. Already preparations are making for a gre convention.

As California is intensely interested in a irrigation promotions the progress of the com mittee, having in charge this meeting, will b noted with more than passing interest.

The people of the State of New York have vo to spend $50,000,000 upon the improvement of their highways. The appropriation of this sum large as it is, will probably convey no very de fiite idea to the mind of the reader unless he is f miliar with the widespread agitation which ha been going on throughout the country for the las fifteen years for the improvement of the high ways; but to the men who have led the fight fo better roads it signalizes a revolutionary change o policy which is of profound significance.—Orchar and Farm.

The Florida Agriculturalist, one of the reall strong class papers of the South finds that will have to change from a weekly to a month owing to the increased cost of paper and o materials which enter into the publishing ness. We shall miss the weekly visits of Agriculturalist, but the cold alternative is pres ed of increasing the price of the paper to $2.0 stead of $1.00, or changing to a monthly, and th editor prefers the latter.

Shop Talk

Our next special isssue, which will appe March 12th, will be devoted to **Gardening and** **versified Farming in California.** This edition contain at least 32 pages and we expect to dev almost the entire issue to the interests of dening, diversified and dry farming of this St In this issue will appear articles of interest fr the most progressive gardeners on the Paci Coast. Our specials of this winter, which h been devoted to Live Stock, Poultry, Decid and Citrus Fruits, have been such a success t we feel much encouraged over this coming is and ask you for support along this line. The tivator is in close touch with and has the co dence of its subscribers, and as an adverti medium pays its advertisers better than any paper published on the Pacific Coast.

The Cultivator is taking the lead of all c papers in regard to the policy adopted in getti out special issues at this particular time. Ot papers are retrenching and cutting expen wherever possible but we feel that it is our d to help our subscribers in hard times and, the fore, are using every effort possible to give th the best along the lines of practical work. T issue will contain articles from the best, m successful, progressive and down-to-date cit men on the coast. And as a means of reach the buying trade of the Southwest, we feel t everyone who has a surplus stock to sell reap the benefit of these large issues. While edition will be larger than our regular issue, the advertising rates will remain the sa Would it not be well if you are already an adv tiser to increase your space for this special and if you are not, to send us at least a trial vertisement as we know we will reach more are interested in gardening and diversified fa ing than in any other one issue during the

Agricultural Notes of the Pacific Coast

Northern California

Oakland has one of the strongest anges in the State.

Gridley is getting to be the center a growing onion industry.

Hundreds of acres are being plant- to grapes near Arbuckle.

Sonoma county Pomona Grange ill meet in Petaluma February 29th.

Anderson recently shipped six cars beef stock to San Francisco in one y.

Farmers in western Tehama county e feeding Missouri corn to their eep.

Many Sacramento valley farmers e purchasing sacks for the coming ason.

The Cloverdale Citrus Fair which on this week is proving to be a ccess.

One blood-thirsty coyote at Peta- ma killed over 50 lambs before it is captured.

The heavy rains of a few days ago ve filled the streams of the entire cramento valley.

Progressive Grange, of Healdsburg, ld an interesting meeting at its t monthly session.

State Board of Engineers seem to ve difficulty in devising a plan for e levees at Oroville.

It is estimated that there are 800,000 cks of potatoes in the district near di which have not yet been dug.

An old scheme is being revived, ich contemplates the drainage of 000 acres along the Sacramento er.

The creameries of Humboldt coun- are producing a greater output is season than usual at this time of year.

The forest reserve in Shasta coun- is proving a great advantage to ck growers who at first feared it uld be a detriment.

The Florin farmers recently closed very interesting two-day institute, ich was largely devoted to small its and diversified farming.

Extensive plantings of White riatic figs are being made near ba City. One estate will soon nt 100 acres to this one variety.

The planting of trees and vines in ter county will be very brisk this son, many new tracts having been ened up and used as new divisions.

t is thought that the coming sea- will see sufficient beets planted the vicinity of the Hamilton City t sugar factory to make it a profit- le proposition for the first time.

The Sonoma County Poultry Asso- tion is having some difficulty in uring bids for its coming year's put. The supposition is that the nmission men and buyers have nbined to discourage co-operation.

The Sutter County Farmer re- rks that the rainfall has been siderably below that of last year l expresses the hope that it will tinue lighter as last year's fall s much heavier than could be con- iently cared for.

The State Board of Prison direc- s has sent out the following: otice is hereby given that the te Board of Prison Directors has d the price of jute bags at 6½ ts per bag and will receive appli- ions in accordance with the law on l after January 27, 1908.

Central California

Salinas has to the present time 7.78 inches of rain.

Watsonville has about eleven inches of rainfall to this date.

Orosi is soon to have a board of trade to talk of its productiveness.

Sand Creek recently overflowed its banks and did much damage in that section.

Almond trees generally over Central California are in bloom and apricots soon will be.

A fraternal life insurance law is to be urged by the patrons of husbandry in Tulare county.

The orchard area in the San Benito Valley will be greatly increased during this planting season.

The Tulare Grange has decided to make a campaign to increase the number of granges in the State.

It is estimated that over 266,000 deciduous and citrus trees will be planted this year in Tulare county.

The Alta irrigation district is to sell this week property of delinquents if assessments of the association are not paid.

"I find the orchards generally in good condition in this county," is the report of Inspector Day of San Benito county.

The advertised delinquent assessment list of the Turlock irrigation district shows a long list of delinquents on 1907 assessments.

Seropian Brothers of Fresno are sueing the firm of Catton, Ball & Co. in various sums aggregating $1,700,000 as a result of old raisin deals.

County Entomologist Morris, in an address before the San Jose Grange said that to gain complete control over the peach moth it was necessary to spray twice.

The recent storms have covered the Sierra Nevadas with snow, and in the canyons and gulches is claimed to be a great depth. On the level many sections report five inches.

The commission appointed by President Roosevelt to investigate the sul phur ruling question will not be able to make a report until near the close of the present session of Congress.

At a recent meeting of the fruit growers' executive committee which was appointed to press the matter of revoking the recent sulphur ruling, the fruit growers were asked to provide funds to maintain the campaign.

Stock growers south of Monterey are having trouble with mountain lions, which have destroyed calves, colts and other domestic animals. One lion was killed on the Hot Springs ranch, measuring nine feet from tip to tip.

It has been finally settled that the next Citrus Fair of Tulare county will be held at Exeter. At one time it was thought that Exeter was a little lukewarm and that Visalia would secure it, but she finally waked up and she is now promised a great fair.

The Farmers' Mutual Fire Insurance Company of Stanislaus county elected the following trustees for the coming year: Claus Johnson, G. R. Larson, Peter Erickson, Mons Bothun, Anthony Morgan, S. J. Booge and John Erickson. G. R. Larson of Turlock is secretary.

Southern California

Escondido wants a cannery.

Celery growers are spraying with Bordeaux.

Tustin is sending out six to ten cars of celery weekly.

Bear valley is now covered with about six incres of snow.

Forest rangers are soon to be clothed in a special uniform.

Canyons of the Sierra Madres are said to be packed full of snow.

Experiments will be made in sugar beet culture near Thermal.

Hemet had 2½ inches of rain or a total for the season of 7 inches.

Extensive planting of onions is progressing in Coachella valley.

Garden Grove ships 50 cases of eggs daily to Los Angeles market.

Three carloads of bees were recently received in the Imperial Valley.

About a dozen cars of celery go east weekly from one packing house at Tustin.

Rose nurseries, near Orange, will ship four cars of rose bushes this season.

One Orange county nurseryman has already sold 400,000 eucalyptus trees.

Oxnard has just given a walnut thief 90 days for swiping a half sack of walnuts.

Thermal is the first postoffice in Coachella valley to secure the rural mail route.

The Oxnard Courier says that the present outlook for sugar beets is very encouraging.

Santa Ana and Riverside are endeavoring to arrange their controversy over the water in the Santa Ana river by arbitration.

Employers of labor in Southern California have discharged many Japanese laborers during the past few days and employed white men.

The farmers of the Imperial valley are feeling much more reassurance regarding their claims owing to rejection of many contests by the land office.

Santa Ana Register says that ranchers are now busy preparing land and putting in grain; that there is no possibility of entertaining the blues.

Eighteen hundred grouse will be released in the National Forests of the San Bernardino Mountains by the State Board of Fish and Game commissioners.

Orange county has over 2000 acres of cabbage this year, which is 400 more than that of last year.

The rain of the 9th brings a total in most Southern California points for this season up to ten to twelve inches. Some sections showing a total precipitation of nearly fifteen inches.

The influx of stock has been so great in the Imperial valley that a shortage of alfalfa has been occasioned. It will be but a few weeks until a new crop will relieve the situation.

A company has been organized in El Centro to experiment in planting sugar beets. They aim to plant seed every month of the year making close observation of production and sugar content

The Coast

The next arid farming convention is to be held at Cheyenne.

A farmers' union has been organized at Wilbur, Washington.

Lewiston, Idaho, held the largest poultry show in its existence last week.

Farmers at Six Prong, Washington, recently held a most interesting farmers' institute of two days.

The Arizona navels for this season have all been shipped and the total output amounted to about 110 cars.

A huge irrigation project of a contemplated cost of $1,300,000 is under discussion at Wenatchee, Washington.

A great apple show is promised yearly in connection with the State Horticultural Society of Washington.

The farmers' union at Dayton recently purchased 100,000 sacks for next year's grain at a favorable price.

One stock raiser at Dillon, Mont., recently shipped twelve carloads of sheep to the Cudahy Company of Los Angeles.

The Southern Oregon Angora Goat Association was organized recently at Grant's Pass, Oregon. C. E. Harmon is president.

Farmers of Whitman county, Washington, are urging the advisability of bulk shipment of wheat as against sack shipment.

Walla Walla Farmers' Union recently made a purchase of 1,000,000 bags at at 7½ cents. This is much better than last year's price.

Members of the Rockford Fruit Growers' Association are buying spraying material in large quantities and supplying members.

Farmers near Hubbard, Oregon, are deriving much profit from raising onion sets. One farmer reports a return of $800 per acre.

Fruit growers of the "Inland Empire" in the great productive plain in Eastern Washington are asking for canners to establish large plants there.

Apple growers in Northern Idaho, 40 per cent. of whose fruit last year was infested with codlin moth, are urging a campaign to reduce the pest.

Prune growers at New Plymouth, Idaho, have found apples far more profitable than prunes and are removing prune trees in favor of apples.

Eastern Washington wheat growers have a large acreage of wheat, which is reported in good condition and for which a long price is anticipated next year.

Secretaries of the different fairs on the North Pacific circuit met in Portland, Oregon, recently and discussed matters relating to next fall's agricultural fairs.

Stock growers near Forsythe, Mont., are jubilant over the recent heavy fall of snow, as the dry weather of the earlier winter had caused suffering because of lack of water.

Hop growers at a meeting at Puyallup passed a resolution agreeing to cut the acreage of hops by one-third, provided the growers of Oregon and California would do the same.

The Deseret Farmer is appealing for more attention to be given to exhibits from the everyday farmer at its State Fair and less to the big interests which usually monopolize the entire space.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

MUSCOVY DUCK.

HAVING been asked for a description and economic values of the Muscovy, we give a short article on this breed.

History.

Muscovy, like numerous other foreign varieties, are kept more out of curiosity than for the table. There seems to be some doubt as to their origin, but the general accepted theory is that they are from South America, where they were found in a wild state. One writer, as early as 1670, refers to them under the name of Turkish duck. It is stated that they inhabit the hottest portions of tropical America. During the day they live in swamps, where they find food, and towards evening may be seen sitting in rows on the lower branches of large trees. They often descend to make inroads into the maize plantations and cornfields, where they do considerable damage, plucking up at the same time the manihot plants from which tapioca is made.

Economic Qualities.

The Muscovy is generally admitted to be a poor layer, but, of course, there are exceptions to the rule. It is a large bird, quick in growth and carrying an abundance of meat, which is darkish in color.

We quote from the Farmers' Bulletin No .64, of the U. S. Department of Agriculture, as follows: "Muscovy ducks are very unsatisfactory birds to keep on the farm with other poultry, owing to their quarrelsome and pugnacious natures. In the wild state, before pairing, the males fight desperately, doing great harm to each other; and this fighting, quarrelsome disposition is inherited by the domestic duck. The temper of the drake is spoken of as abominable; his persecution of other poultry is never ceasing, and is credited with having attacked even children when his 'dander is up.' The flesh of the Muscovy is considered good when eaten young, and compares favorably with that of any other duck. They do not lay nearly so many eggs as the common birds. When bred they must be kept in yards by themselves, and their wings must be clipped to keep them from flying.

Description.

"The head of the Muscovy duck is rather long, and in the drake it is large, the top being covered with long crest-like feathers, which rise and fall when the bird is alarmed. The bill is of medium length and very stout. The face is the most distinctive part of these ducks, the cheeks being naked, with a scarlet fleshy space around the eyes, and the base of the bill caruncalated also with scarlet folds. The large, red face gives them a savage appearance, and to some it is hideous. The neck is well curved and of medium length; back long, broad and flat; breast full and broad; body long and broad. The wings are very long and stout; tail is rather long, with abundance of stiff feathering. The drake does not have the curbed feathers in the tail, as do other ducks.

"There are two varieties of Muscovy ducks, the colored and white. The standard weights are. A drake is 10 pounds; adult duck seven pounds; young drake eight pound and young duck six pounds."

* * *

AROUND THE YARDS.

Ducks have no crops and wh grain should not be fed

* * *

Water is not necessary for duc raising. We mean a swimming poo

* * *

Indian Runner ducks are great eg layers. Some go pretty close to 2 eggs a year. Duck eggs sell well.

* * *

Place water near the feedi trough so the ducks can wash dow every mouthful of food as they naturally.

* * *

With proper care a duck will l from a hundred to one hundred a twenty-five eggs in one season. Th should always have plenty of eg producing food and good shelter.

* * *

The best way to start in rai ducks is to begin with only a learn all you can about it, and try ot breed all the good birds y can take care of without crowdi the first year. If at the end of t year you are satisfied to go ahead, t on a large scale.

* * *

After ducks are hatched and beg to eat, feed them some soft feed a give them a shallow vessel for wat ing, for a small duck can get too w Always give ducks plenty of water drink, and I think it should be ne the feed trough, for ducks wash do their food with water and cannot e well without it. I find my duck better when the food is changed ten. I feed scraps from the table bread, potatoes, apple parings, meal, etc. They should be kept wa at night to keep in a growing con tion. A wire netting fence about t feet high is nice to enclose a du yard. Ducks require more fresh than chickens and can stand m cold weather. I believe there is m money in ducks than in turkeys, ducks are not subject to disease very seldom ever lose a duck afte is hatched.

* * *

What is the Trouble.

What is the matter with my ch ens? They go around gasping breath and three have died. I cooked potatoes, bran and short the morning, wheat and corn in afternoon.—H. G. T.

We can't diagnose the case v the meager description you g Kindly give all symptoms in writ that we may be able to give an i ligent answer to questions.

* * *

Incubating Duck Eggs.

Will you kindly tell me through columns of the Cultivator why I h never been able to make a good ha of duck eggs in an incubator. same eggs under a hen hatch fine have always handled duck eggs same as hen eggs. Do they want be handled different? If so, in w way? I have turned them, a them, and run them the same t perature as hen's eggs, with the of the thermometer resting on a the egg. If the thermometer has hanging up the eggs might hav two degrees cooler throughout hatch. Are the eggs under a he or is the hen's body 103 and the some cooler?—J. W. L., Garde

This question was referred to

S. C. White Leghorns
The Kind
That Pays

For my breeding birds I each year select a number of my handsomest, earliest developing pullets and trap nest them during their entire first laying year. The next season from these I select only those having satisfactory laying records. In my breeding pens are only hens of proven worth in their second and third season, and no bird that has ever shown a trace of disease. Each pen mated eleven hens to one handsome cock. I believe there is not in California a handsomer or better lot of birds and few as good. Can furnish eggs for hatching from these birds at $1.50 for 15, $7.50 per 100 or $60 per 1000. Let me book your order now.

When writing advertisers, mention Cultivator.

Frank J. Ironmonger, of Los Angeles, who writes:

Many novice incubator operators are continually asking the questions: How can I hatch duck eggs in an incubator? Why do the ducks pip the shells and then fail to hatch?

My experience has been well divided with hot-air and hot-water incubators, and the hot water gives much better results. The principal reason for this is because most of the hot-air machines destroy by baking or drying the moisture thrown off from the eggs necessary to insure a successful hatch.

When purchasing a machine be careful to select one that embodies the following important features, viz.: A large, deep egg chamber and a roomy, well ventilated nursery. Duck eggs throw off a greater amount of impurities than do hen eggs and at hatching time require more air in the machine. Hang the incubator thermometer so that the top of the bulb will hang about on an average with the top of the eggs and run the temperature at about 102 degrees for the first week. Beginning with the second week run temperature to 102½. Twice a week, the second, third and fourth weeks of incubation, when the eggs are out cooling, spray, sprinkle or moisten them thoroughly with luke warm water. The tray of eggs should remain outside the machine until moisture has evaporated.

At the beginning of the third week run the temperature at 103 degrees. After the first week air your eggs well each day, in order to obtain a good sized air space. While the eggs are out airing keep the incubator door open; it will purify the air in the machine. Do not put moisture in the machine; it does not give the desired results; instead of decomposing the shell—as it does when applied directly to the shell, as explained before—it goes through the shell to the duck, where it is not wanted; but when applied to the shell it will decompose and soften, allowing the duck an easy time extricating itself from the shell without the operator's assistance.

* * *

DUCK FEATHERS.

Where any considerable number of ducks are killed each year, it is best to save the feathers, for they sell readily at thirty-five to fifty cents a pound to dealers in most of the large cities. Chicago and New York take the greatest quantities. Eight to ten six-pound ducks will produce a pound of feathers, so that the revenue from each will be about five cents for feathers alone.

Only the soft feathers should be saved, but most of the feathers are soft, so it is necessary to discard only those of the wings and tail. As these should always be plucked first, they may be thrown aside and the remaining feathers thrown into a box near the operator. Pin feathers should not be mixed with those that are to be sold. After each day's picking, the feathers should be spread on the floor of a dry loft, where the sun and air will dry them thoroughly and cleanse them. When they are thoroughly dry, they should be placed in clean cloth bags and forwarded to market.

In every neighborhood there is at least one farmer who bears the reputation of being able to do as much work in one day as the average man can do in two. The reason usually lies in the fact that he has the very best tools on the market with which to work, and he keeps them in the very best condition possible.

FOOD FOR HENS.

The most costly portion of the egg is the white or albumen. This is derived from the nitrogenous matter of grains, but principally from the animal foods. Hence meat, milk, insects and grains, rich in gluten, are the best foods for that purpose. One of the cheapest articles that can be used is blood. If it can be secured from the slaughter house, mixed with the ground grain and cooked, it will be highly relished by the hens, and will largely assist in egg production. When meat is used the lean portion should be preferred, as the fat is of but little service if corn is used in the food. One of the cheapest substances for adults is milk, whether sweet or sour. Regarding the use of blood it is well adapted for egg production. It can be given with advantage to chicks as well as fowls, and be used in several different ways. First, by mixing one pound of blood with three pounds of mixed ground grain, and the whole mixture cooked as bread. There is nothing superior to it in such form, not even meat. Second, if the mixture of blood is put in a bag and boiled it makes a food that not only takes the place of meat, but it is better for the purpose. As the blood at some slaughter houses is usually wasted there should be no difficulty in procuring it. It will keep any length of time in winter, but if not cold weather, should any portion remain after feeding, it may be added to the compost heap, where it will still be valuable as one of the best nitrogenous fertilizers that can be used.—Coleman's Rural.

BIRD LIARS.

"The goose is a frightful liar," said a nature faker. "He quite puts me to shame."

"Really?"

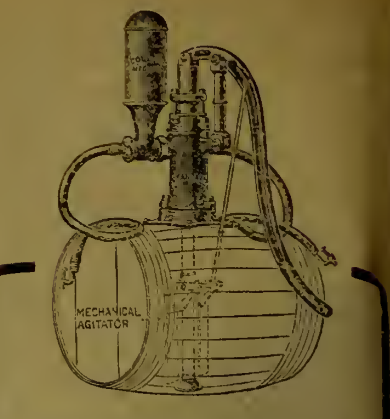
"Really. You know how the goose, when you draw near it, hisses? Well, with that hissing sound it says: 'Scoot, beware, I am a serpent.' Yes, from primeval times the goose mother, sitting on her eggs in a place of reeds and sedge, would not fly when an intruder appeared; but, keeping her body concealed amid the leaves, she would stretch out her long, flexible neck and hiss wickedly. 'A snake in the grass,' the intruder would say to himself, as he retreated; and on her eggs the goose would chuckle in a sly, contemptuous way.

"The lapwing is another liar. Approach her nest and she sets up a distressful crying and runs back and forth in front of you, trailing one wing as though it were broken. You follow; you think to snatch her up in your hand; with this lie she lures you away from her young.

"The thrush, in time of drought, beats with his feet on the grass like a clog dancer. Thus he lies to the earthworms; he makes them think that it is raining. Up they come in silent haste, and the deceitful thrush makes a rich meal."—Philadelphia Bulletin.

LARGE SHIPMENTS OF BABY CHICKS.

The Pioneer Hatchery Company is shipping chicks by the thousand all over the State. The firm takes especial care in handling them, and the loss in transit is very small. Recently on a shipment to Watsonville not a chick was lost, and a party at Tucson reported every chick arrived alive and chirping. By addressing the above company at 711 S. Main street, they will mail a complete price list of chicks and eggs.



Double-Acting Sprayer
With 3-inch brass-lined cylinder, brass-encased outside-packed plunger and brass valves. Large air chamber and long lever. Powerful enough for two leads of hose and four nozzles. Can be placed on end or side of barrel.
Complete outfit, including Pump with suction pipe and strainer, one 25-ft. lead of 1-2 in high pressure spray hose, 6-ft. iron pipe extension and one Seneca spray nozzle (no barrel or agitator) packed ready for shipment for $12.75.
In ordering state whether you want sprayer for end or side of barrel.

Why Not Accept Our Offer and Try a Glendale Incubator for Two Hatches?

That's a fair proposition isn't it?

You can use one of the Glendale Incubators at your home, through two hatching periods—without cost.

At the end of that time if you are not suited—if it hasn't fulfilled our promise—return it to us and get your money back.

We will pay the return freight and even the oil you have consumed, thus the test won't cost you one penny. Don't you call that a liberal offer, and do you think we could afford to do it if we didn't know our machine would "make good?"

Our incubators must accomplish the purpose for which they are made—that is, hatch every hatchable egg and not only hatch them but get them out of the shell strong and healthy. You can't afford to waste your time and money hatching weak chicks or cripples.

We are anxious to send you one of our incubators in order that you may run it and satisfy yourself that our statement—that it is as good an incubator as money can make—is a truthful one.

We haven't space here to go into details of construction, but will say that it is a hot water machine, specially ventilated providing pure air and moisture, and heated by the best safety lamp made, and the principle on which it is constructed is right.

The chicken business properly managed is a winner, but you must have the "equipment" and equipment on the poultry farm means hatching facilities. Your equipment is O. K. and you will be safe if it's a Glendale.

Really now, can you afford to be without one?

Write for our folder or better yet call and see us at 803 South Main Street, Los Angeles, California

Dairyman's Profit

Give a cow good food and *power to fully digest it* and she in return will give you ample reward at the pail. Noted authorities tell us that something to correct digestive troubles becomes a necessity if the maximum flow of milk is to be maintained, because overfeeding, sooner or later, impairs the stomach and nerves, preventing necessary secretions of gastric juices.

DR HESS STOCK FOOD A TONIC

puts the cow in condition to pay. It is the prescription of Dr. Hess (M. D., D. V. S.) and besides ton[illegible] ments contains iron for the blood and [illegible] to cleanse the system. It shortens the time required to fat an animal, gives appetite for roughage, and shows its value by lessening the per cent of nutriment lost in the droppings.

Sold everywhere on a written guarantee
Costs a penny a day for horse, cow or steer.

100 lbs. $7.00 **25 lb. pail $2.00**

Smaller Quantities at a Slight Advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal compound and this paper is back of the guarantee.

If your dealer cannot supply you, we will.

DR. HESS & CLARK, Ashland, Ohio.

SANITARY MILK.

IN A sanitary stable, milk is drawn into covered pails. There are several styles of these pails covered with patents. The old time unpatented pail has the merit of being inexpensive and is easily cleaned. In buying a patent pail see that the curves are well rounded so that the hand and brush can be used on all parts. The old style of pail was made by having a tin cover made for the regular milking pail. In the cover a hole one inch across was cut to admit the nozzle of a funnel. This funnel was made with a wide flare, and on the edge a flat ring several inches wide was soldered. A second loose ring slipped over this first one. The funnel then had a piece of cheese cloth put over it loosely and the tin ring fitted it firmly to place. The funnel was inserted in the hole of the milk can cover. The milk from the cow fell directly on the cheese cloth and strained through it into the pail. When the milk fills the pail and the cover is removed to empty it, a fresh piece of cheese cloth is put on the funnel. The soiled strained cloths are dropped in a pail of weak sal soda water. These cloths are washed, dried and used until worn out.

Clean Milk.

Clean milk and careful cleansing of the milking utensils can be made routine work. Drill the men always to do the same things over and over again in the same order. The cans first filled and well rinsed out with cold water. Then scrubbed clean with hand brush and plenty of hot water and sal soda, well rinsed with hot water, then turned over a steam jet and well steamed. Put, while hot, on the racks in the open air, turned upside down, until they drain out and dry with their own heat. The use of plain sal soda is better than soap and soap powders. Use weak solutions with quantities of hot water. Soap and rags keep away from the dairy at all times. Cans that show worn spots in the tin or rust should not be used for milk. A small crack will hold bacteria enough to seed down a whole creamery. New cans are rarely enough found nowadays. The dairymen have rejected poor soldering that the jobber in turn refuses to accept imperfect goods from the manufacturers.

Glass Bottles.

For milk delivery the glass bottle is preferable. The law in many places forces the housekeeper to return the bottles washed. In California this does not always occur. I have had bottles returned with the remains of pickled onions in them. A patent paper bottle is now offered for milk that is very promising, but all these niceties cost money. The same woman that will not hesitate to have an extra feather on the Easter bonnet, will hesitate and haggle desperately over a cent more on a quart of milk. No one can see what goes into our stomachs when we walk the streets, while the bonnet all can see. I heard at a farmers' institute a paper read that recommended the glass milk bottles as a convenient package of receptacle to hold the groceries used in light housekeeping.

Bottles are handier to clean than are cans, with a good bottle brush and plenty of hot sal soda water they are cleaned and put on a rack upside down. Then the rack of bottles is put into a steam box, filled up with rinse water and the steam turned in until the water boils around them. After five minutes of boiling a tap at the bottom is opened and the water let run off. The steam continues for five minutes more and then turned off. The bottles are left to cool off before the chest is opened. The cost of the bottles is offset in many cases by the saving of loss of customers. The drivers have a neat little way of stretching the milk by watering it and selling the extra for money; needless to say this money is "knocked down."

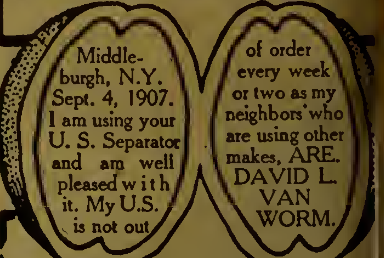
Aeration.

At times the health boards insist on farmers using aerators. These are often a detriment to the milk rather than an advantage. Many claim that they are a positive injury to the keeping qualities of the milk at all times. There is truth in both statements. Milk run over an aerator in a foul stable will be more contaminated than if it were left to cool naturally. In a clean, airy place, the milk run over the aerator is quickly cooled and gases are thrown off, then the milk can be put away and properly protected. The souring of milk is natural, and it can only be retarded by coolness. In the ordinary ice chest or refrigerator it will keep sweet longer than when exposed to outside temperatures. When milk is kept too cold to sour by the development of lactic acid bacteria, it will still spoil by the development of other bacteria. The bitter milk and cream of the winter time is an example of other bacterial life than that of lactic acid, that every woman that makes butter at home has run against some time in her life.

Milk sometimes develops toxic poisons, and it is found in ice cream that has slowly melted and been refrozen, the ptomains are often deadly. The ptomanies poisons are regarded as the results of the life processes of bacterial growth rather than the bacteria themselves. At 60 degrees bacterial growth is slow; at 50 degrees very slow and at 39 degrees it stops altogether. Milk kept on ice will remain sweet a week; the use of ice is rarely practiced in California as the expense is too great. A temperature of 60 will keep the milk sweet twenty-four hours, by chilling the milk as soon as drawn and putting the cans into barrels of water or into chaff-lined barrels or even wrapping the cans in wet sacks, the milk can be kept very sweet for twenty-four hours. Cooling by evaporation is constant, and if the water is kept constantly dripping over the surface of a can it will reduce the milk several degrees.

Bacterial growths in milk are largely affected by the three conditions of time, temperature and the lactic acid. This bacteria has a germicidal effect of many other forms. The range of temperature in which bacteria live is not after all very wide. There is one point proved at which they increase with marvelous rapidity. From a bulletin of the Storrs Station I take the following: "Two samples of the same milk were used, one placed in an ordinary room at 70 degrees; in this the increase 750 fold in an hour, while milk held at 50 degrees only showed a bacterial increase of five fold in ten hours. Milk kept at the temperature of 98

The Whole Truth In A Nut Shell



Middleburgh, N.Y. Sept. 4, 1907. I am using your U. S. Separator and am well pleased with it. My U.S. is not out of order every week or two as my neighbors' who are using other makes, ARE. DAVID L. VAN WORM.

It's "Reliable"
And RELIABILITY is "THE quality of qualities." A reputation for RELIABILITY is not won in a day, a month or a year. Consistent performance during the slow testing of time, *alone* is sufficient to prove that most satisfactory of qualities — RELIABILITY Each year for past sixteen years, the

U.S. CREAM SEPARATOR

has been adding to its reputation for RELIABILITY which is UNEQUALLE today. Dairymen today choose th U. S. because they KNOW it can b depended upon to do the Best worl ALL the time and the Longest time too. Time has PROVED it.

Mr. Van Worm's few words sum up completely the many reasons why dairymen everywhere are fast exchanging their old style, unsatisfactory or "cheap" separators for the RELIABLE, clean skimming, up-to-date U. S. If YOU have one of "the other kind," WE'VE a proposition to make you. Just ask us about it, please.

The thirty illustrations in our new catalo enable you to easily SEE why the constr tion of the U. S. makes it the most REL ABLE and profitable. Won't you send tod for free copy? Just ask for "No. 20

Wood Sole Boots and Shoes

We wish to call your attention to the fact that we have a large stock of Wood Sole Boots and Shoes of the very best quality. The Uppers are made of the very best quality Milwaukee Oil Grain. The Soles are well-shaped, and are an exact and comfortable fit, and our ***Patented Fastening*** makes this a ***Waterproof*** Shoe. We all know wood is a non-conductor, consequently it is much drier and a great deal ***warmer*** in Winter. They are lighter than Rubber or Leather Shoes and Boots. Shoes, $2.00; Boots, $3.25.

O. J. Weber Co. 555-557 S. Los Angeles St., Los Angeles, Cal.

l curdle in 18 hours; kept at 70 l curdle 48 hours, while in an ice est at 50 degrees will keep from rdling for 14 days or more. In w milk the bacteria are stationary a short period, while at ninety dees the bacteria growth is retarded two hours; when at 70 degrees bacteria does not increase fast four hours; then after six hours increase is very rapid. In elve hours there may be millions.

"If the temperature of the newly awn milk is reduced at once to fifty grees, this preliminary growth of cteria may be retarded; at the end forty hours, in some experiments, ere were no more than at the beginng. The experiments show that e keeping of milk after all depends ore on temperature than on any ing else. The maintenance of a w temperature is, therefore, more cessary than even cleanliness. The cterial count is more dependent on mperature at which the milk has en held than on other precautions. ne bacterial count has, therefore, en discredited as a factor in securg sanitary milk. The preservation milk from pathegenic or disease rms is more a matter of controlling e surroundings as the water used in eaning cans, than counting the rmless batceria that may swarm in e milk after it has been kept at imoper temperature."

ROLLING RESTS A MULE.

A writer in Farm Progress says:

There are many who claim that a ule is superior to a horse in intellience, and there seems some ground r such belief. The chief claim is at the mule knows better how to ke care of himself, and as for lookg out for number one there are few imals in creation that are superior.

There it at least one illustration of is fact—so old that it is almost new. you unharness a tired mule for a oment by the wayside and allow him brief interval of rest, the chances e that he will not at once begin to raze as would a horse. The mule ill almost instantly throw himself to e ground and "roll," kicking his eels in the air. He will keep this up r a much longer time than a horse ould, and apparently put his whole ubborn heart into these rather reiarkable gymnastics, and after arisg will wisely proceed to graze.

All farmers have doubtless noted his, but they have perhaps failed to note the main point. When the mule arises, he is no longer a weary mule, but a fresh one. His brief tumble and roll has refreshed him as much as if he had slept all night. He is weary no more because he has cured himself of weariness by a remedy known only to himself.

This discovery was made and kept secret for many years by monks in the Middle Ages. The subject was discussed at length in a manuscript of 1460 found in a Roman monastary, and was one of the secrets of that brotherhood. Because the source is antique there is no reason why it may not be true and it might pay the modern farmer to put this to a test.

A PROFITABLE COW.

The following are the essential points in a good dairy cow, as stated by a practical man:

A continuous milking cow will almost always have a large jaw, indicative of good feeding qualities; a long slim ewe neck, accompanied by a thin sharp wither. As you pass down her back you will find the double chine; her ribs will spring from her back, so that they form a wedge, viewed from the front, on both sides.

Next, you will find high hip bones—the higher the better—if you can hang your hat on them all the better. Her thighs will be flat, and she will have a large paunch, the more the better. What is the value of the last indication? The greatest bulk of food is composed of roughage. The cow cannot make something out of nothing; to produce a large flow, she must be a big eater. If she and her ancestors are and have been good feeders, and have had the structural form here described they will be big producers. In addition, the cow must be loose-jointed, and she must have a wedge shape, viewed on both sides, as well as from the top and under lines. Such a cow, so built, cannot put the feed on her back, but will utilize it to put it in the pail.

DOCKING LAMBS NOT CRUEL.

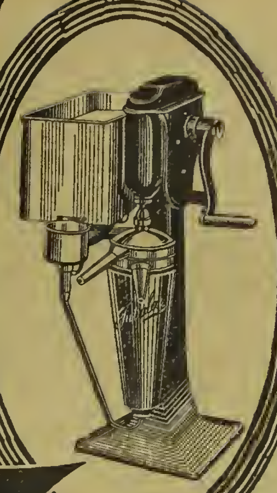
All lambs should be docked. It is not a cruel operation, if performed when they are a week old, and it is one that is absolutely necessary for cleanliness and appearance.

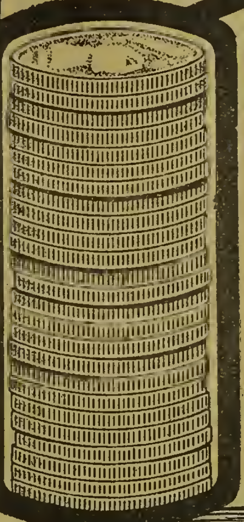
Docking looks to be simple enough, but it requires great care. If the tail is cut too short with the knife the lamb is likely to bleed to death. Some shepherds sear with a hot iron the end of the tail after being cut with a knife or chisel on a block of wood, and this generally stops bleeding.

After the operation the end of the tail should be covered with clean pine tar to prevent flies from troubling the lambs. The animals should be watched closely, particularly if the docking is done late in the season, until the wound has healed, to see that no flies have attacked them.

PORTO RICO COW HUMBLE.

"The Porto Rico cow," said the man who had been stationed on the island as a soldier for two years, "is as humble a looking animal as one ever came across. I never saw one hook or kick or display the least temper, nor did I ever find any one else who had. The first time I ever saw one milked was a matter of greatest surprise. When a boy had driven her up to the shed, where she stood chewing her cud and switching her tail, the owner brought out a rope and tied her head fast to a post. Then a second rope made her front legs fast. A third did for her





CREAM PROFITS

If you are selling your whole milk to the Creamery you are not getting as much profit from your cows as you should. In fact you are losing 50 per cent. Without increasing your feed bills one penny or milking another cow you can double your cream profits. This is demonstrated by thousands of dairymen and farmers every day in the year.

The Sharples Tubular Separator

gets all the cream in the milk—it skims out every cent of profit, so that you can turn it into cash. Here's one letter that tells the story of how to double your cream profits:

Union Mills, Ind.

GENTLEMEN:—We have a Sharples Tubular. Before we bought it, we bad been selling our milk to a creamery at Union Mills, getting not more than $8.00 a month, **but since we have the Tubular, we have been getting twice more,** and are so satisfied with the Tubular.

MRS. JOHN C. MILLER

Such proof as this ought to convince you that a "**Tubular**" will be a money-maker for you. The extra profit will soon pay for the separator while it will keep right on earning these big profits for years. Write today for our new catalog and **free** copy of that valuable book, "**Business Dairying.**" Ask for book No. 260.

THE SHARPLES SEPARATOR CO.,

West Chester, Pa. Toronto, Can. Chicago. Ill.

IMPROVED IN EVERY FEATURE

Have you seen and examined the New and Improved 1908 LE LAVAL Cream Separators? If not, and you own one or more cows don't further hinder your best interests by delaying longer but let us give you a free demonstration in your own home at once. You will marvel at the mechanical perfection, the wonderful simplicity and convenience of these new machines. These new machines show improvements in every feature, from the supply can to the base of the machine, and mark the greatest move forward in separator construction since the invention of the first practical separator by Dr. De Laval in 1878. If you have milk cows you cannot afford to be without one. The new De Laval skims closer, has greater capacity, operates easier and is more ideal in every way than De Laval machines have been even in the past. The improved De Laval is actually ten years in advance of any other separator made today. There are ten new styles, ten new capacities and ten new prices. There is a machine for every dairy, from the smallest to the largest and at a price that will fit every pocket. Don't regret later that you didn't see the De Laval before you bought a machine but write us today for our handsome new catalogue describing the machines in detail and a free demonstration in your own home. You will be surprised. Don't delay.

Gives Surprising Results

No pest is quite as discomforting to an animal as the common sheep tick—they actually suck the very life blood of the sheep. All sheep have ticks. Why let the tick eat up your profit? Kill him on the spot.

Instant Louse Killer

is guaranteed—your money back if it does not do as we claim.

It is a powder which may be used in *zero weather*, and in less time than it takes to prepare a dip. No slop, no muss, no danger. It is the formula of Dr. Hess (M D., D.V.S.) and destroys lice on horses and cattle, bugs on cucumbers, squash and melon vines, cabbage worms, rose slugs, etc. It is also a disinfectant and deodorizer. In cans with perforated top. Look for the word "Instant" on the can.

Sold on a written guarantee.

hind legs and a fourth went around her body. She was trussed up until she could hardly wink an eye.

"What on earth is all that for," I asked the man.

"'I am going to milk her, senor,'" he replied.

"And do you tie her up that way twice a day, taking half an hour each time?"

"Always, senor."

"But she doesn't look to me like a kicking cow."

"Perhaps she is not. I do not know."

"I cast off all the ropes," said the ex-soldier, "and then took the pail from him and sat down and milked. The cow stood quiet as a monument. During the performance a score or more of men and women had gathered around, and when it was over I said:

"There, now. But why tie your cows up to be milked?"

"Santa Maria!" gasped the old man, as he looked around on the crowd and crossed himself. "If we are not to tie up our cows to be milked, how long will it be before these Yankees will be telling us that it is not necessary to keep our eggs four weeks before eating?"

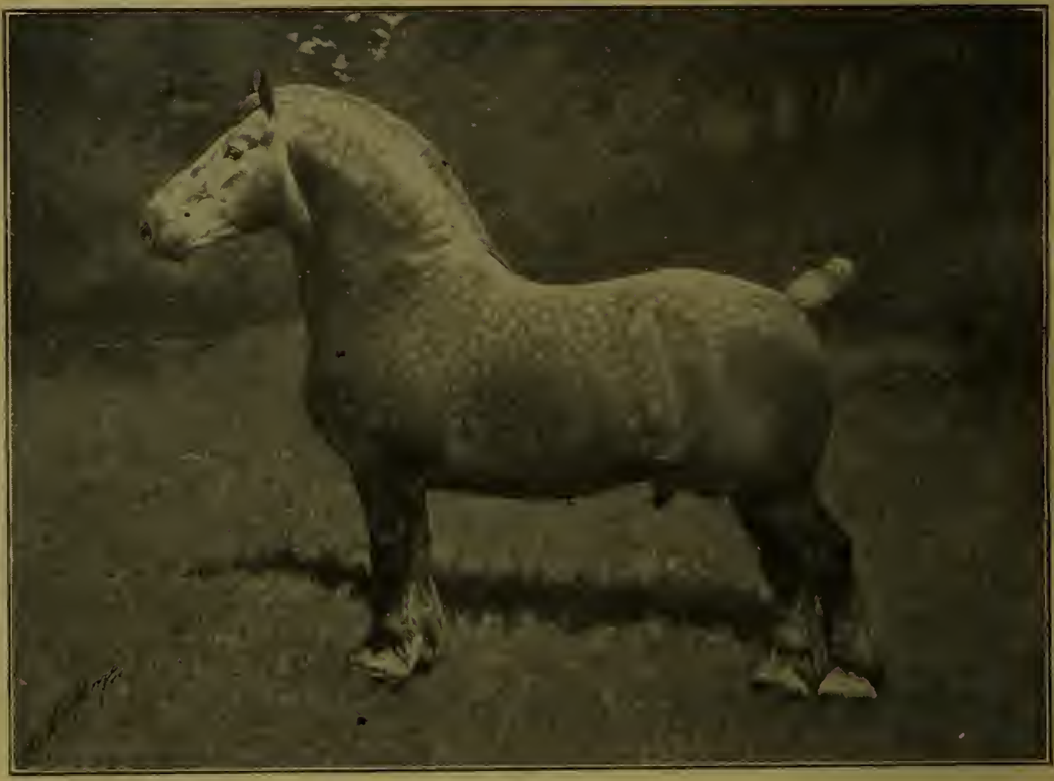
WHERE NATURE NEEDS HELP.

It is not impossible that, unassisted, nature might, in the course of some eons of time, have evolved as good a horse as some of those Percherons or German coach horses on exhibition out at the State fair, but it is tolerably certain that, since the dawn of creation, nature never did anything of the kind unassisted. Human intelligence having come to the aid of nature, some of the most splendid specimens of animal life imaginable have resulted. All honor to the breeders of fine animals! They are performing a great service to humanity, ever in need of the best, and they are honoring Almighty God in putting to use the sublime laws ordained.

And yet there are those who vainly cling to the superstition that any cow that will give milk is as good as another, unless it just happens to be otherwise; that a hen is a hen no matter what the breed, and that the cattle that it pays best to rear are those that grow lean and hollow, bone and gristle "rustling for themselves." It is the dread inertia of the non-evolutionary mass that sits like an incubus on the shoulders of the race and prevents it going forward. Near the close of the seventeenth century the English gentry conceived a passion for breeding better stock, and as a result of the impetus so given to intelligent breeding greater progress was made in two decades than had previously been made in four centuries. That opportunity is still open to those who will take advantage of it.

It costs no more to rear and sustain a cow that will pay for herself each year than it does to rear and sustain a cow that will eat her head off each year of her life. The difference between poverty and affluence in farming is the difference between compound-interest cattle, horses and hogs, and horses and cattle that eat like a mortgage and produce little but vexation of spirit.

For fifty years the tillers of the soil of this valley have been checking against the stored fertility of ages while depositing nothing to the credit of the fertility of that soil. If some of these checks have been returned branded "no funds," whose fault is it? With pump irrigation no longer an issue among intelligent men, with wornout wheat ranches planted to alfalfa, with cattle, horses and hogs to eat the alfalfa, the Sacramento farmer will return to the soil everything he takes from the soil, and so establish a credit balance that he can never exhaust, for he will be drawing against air and water, and these never grow less in quantity or suffer impairment in quality. That way prosperity lies prosperity that will grow less as feeds, ever extending, yet never c suming because always renewin Sacramento Union.



BELGIAN STALLION.

ORCHARD PLANTING.

Continued from Page 193.

ive any specific figures calculated neet varying conditions; it will age, however, all the way from ıty-five to sixty dollars per acre.

hing of Beauty and a Joy.

ı experience covering nearly ıty-five years in practical orange lemon orcharding, coupled with ·ly a like period in the propagat- and growing of citrus trees for ting, has only strengthened me he opinion that orange and lemon ving, when the conditions of soil climate are congenial to the fruit, ot only one of the most profitable rsions of our horticultural de- pment, but also one of the most ·ing. A well cared for orange lemon grove is certainly a beauti- feature of the landscape. Thus, ıs culture is one of those rare binations of business and pleas- where utility and beauty go down asile of time hand in hand, and ›y is he who possesses a bearing ard, that by reason of its en- nment and care and attention it reecived, yields its owner a hand- e living and something for the erbial "Rainy Day," and at the e time gratifics his love for the tiful in nature, making his trees companions, affording a solace a joy for every day of the year.

NEFIT FROM COVER CROPS.

Continued from Page 190.

ng the solutions of fertilizer to nanufactured into starches and r and then sent back to the tree row its fruit; and I have to say ou that not one single leaf wilted hat twenty acres that year, and one irrigation during the sum- time was given to that twenty s for two years; and other pieces, situated, like treated, were test- he same way. A scientific gentle- was told that, and he thought it ›ssible, but he took the trouble o there and investigate the condi- s down thirteen feet in the soil, ng it and taking it to the labora- and estimating the quantity of er in that soil subject to the root em of the tree, and his decision : "Yes, you can do it; yes, you increase the absorptive and hold- power of your soil by filling it humus, so that in an occasion listress you may be able to save orchard without irrigation ugh a season."

ıe power of absorbing water is t times greater in a humus soil ı in a soil without humus. To the best out of your soil you must friability, tilth. Take a cubic of soil. It presents but six sides he air root of the plant. But di- it up into as fine particles as you by proper cultivation and you find that there are three million s to the cubic inch which can be hed by the air root of the plant the fertilizer taken from it that ln the soil moisture. Take a c foot of soil and, if I mistake not, ave seen somewhere that when it ivided up into that fineness which can get by proper manipulation he soil it will present to the root em sixteen acres of surface. nk of it, that when you take that and divide it up it will spread r sixteen acres! I don't think I exaggerating. I tried to lay my d on the authority this afternoon. ere are some here who know and y can contradict me if it is not e.

To be continued next week.

MAN'S FOOD ASSURED.

One of the greatest problems which has in late years occupied the attention of scientists has been solved by the discovery of new deposits of nitrate of soda. "How can the exhausted fields and farms of the world be replenished with the nitrogen which alone can produce food for the race?" was the question. The finding of new deposits in Chile, covering a vast area is the answer.

Nitrate of soda is not as visibly connected with the welfare of the race as sunshine, but it is almost as important an element in the development of the individual and the perpetuation of the race. Some scientists have gone so far as to compare the effects of the exhaustion of the nitrate beds with those which would follow upon the withdrawal of the sun from the earth. "No sunshine, no growth," says science. "Without nitrate of soda to fertilize the world's exhausted fields and farms, there will be a long series of constantly diminishing crops and a consequently dwindling, degenerating, starving and dying-out population," says agricultural chemistry.

The Chilean government for purposes of revenue, took charge of the vast nitrate deposits soon after their discovery. It has ever since not only controlled the known nitrate beds, but has systematically searched for others. Deposits of nitrate, of varying size, were constantly being discovered; and now comes the discoveries of nitrate of soda beds which will last not only hundreds of years, but longer. Two immense areas have only recently been discovered. Together they contain more than one billion tons of nitrate of soda.

Nitrate of soda is the world's leading fertilizer and it is gratifying to note that the American farmer may now secure unmeasured supplies of his best fertilizer—contrary to the general rule—at rates cheaper than ever before.

PROGRESS.

Near the town of Up-against-it, in
the land of Root-or-die,
We have found our very finest inspiration, you and I.
Toiling up the hill called Have-to,
with Compulsion for a guide,
We have made the sort of effort that
was never yet denied.
In the way were Can't and Couldn't,
with their brother, What's-the-use.
While our dearest foe, Born-weary,
seized with joy each poor excuse.
Yet behind us, unrelenting, drove our
heartless master, Must,
And our feet essayed no lagging,
spite of hill or heat or dust.
It was there we grew the sinews for
the struggle—you and I—
Near the town of Up-against-it, in
the land of Root-or-die.

Near that village, Up-against-it, in
the land of Root-or-die,
We discovered possibilities undreamed of—you and I.
Were there heartaches in that journey? Little, then, our master
cared,
As along that stony highway under
whip and spur we fared.
Bread-and-butter trudged beside us,
with a keen and ruthless goad,
That should quicken halting footsteps if we loitered on the road.
Pride and Spunk, two comely sisters,
lured us on with myriad wiles—
All the master's welts were vainless
as we feasted on their smiles.
So our hearts grew strong to conquer,
as we plodded—you and I—
Past the hamlet, Up-against-it, in the
land of Root-or-die.

—Strickland W. Gillilan in Success.

MY ANGEL.

YOU need not laugh, reader. If you could have seen her, you would have used the same exalted epithet in describing her; or rather, if you had been as desperately in love with her as I was from the very first words of the introduction that accorded me the privilege of basking in her smiles.

It is useless to attempt to describe her in detail—poets, painters and authors have exhausted all adjectives and similes with regard to feminine lovliness. I can only say that Gladys Seymour was to me an epitome of all that was beautiful, graceful, fascinating and altogether irresitible to the favored mortal who is, or has been, in love, further detail would be suprefluous. In view of all this, however, I ask my reader to consider what a fortunate, envied mortal I was when, at the end of six months' ardent devotion at the shrine of my divinity, I took—metaphorically—my courage in one hand and my heart in the other, offered myself and all I possesed, and was accepted. The remainder of that evening flew by like enchantment; I seemed to be walking or rather dancing on air; and when I finally bade her good night and wended my way to my own home, it was in a state of delirious happiness that must be felt to be appreciated.

Two blissful months followed. Every available moment that I could spare from business found me at her side, breathing into her ear the ardent expressions of my devotion, calling her my queen, my angel, and endowing her with all the virtues and perfections that have been possessed by mortals since the world began; and when compelled to be absent from her for any considerable period, I would commit my sentiments to writing and send them by post. During those two months my rapturous encomiums were received by her with a sweetness and serenity which proved how well they were bestowe and every one of my letters w promptly answered.

At the end of that brief period, change sudden, sharp and cruel ca over the spirit of my dream. O evening—as usual since my eng ment to Gladys—having left my bu ness at an early hour, I wended n way to my lady love's residenc feasting my imagination with antic pations of the welcome I was sure receive, and the delightful time should spend in her society.

Ringing the bell and being i formed that she was in the parlor, hastened thither with a beating hear but as I opened the door and steppe into the room, what was my su prise, consternation and alarm wh instead of advancing to meet me wit hand outstretched and her lovely fa animated with joyous welcome, sl retained her seat, with her han folded listlessly in her lap, and an e pression on her face, which, if sl had been an ordinary, common mo tal, I should have called a frown.

For a moment I stood rooted to t spot by this unexpected and myst ous reception; then coming quickly her side, I sat down and seized h hands in mine.

"My love! My peerless Glady What has happened? Are you ill—il and I in ignorance of it?"

If I had been surprised before, ho was my consternation increased whe she pulled her hands away from min and answered pettishliy:

"Ill? Of course not! What mak you suppose anything so sillly?"

"How could I think otherwi when for the first time since we b came engaged you have failed to c forward and welcome me, my an I retorted.

"Oh, well, I was tired. And not see any necessity for rushing ward as if I had never seen you fore. I begin to be tolerably well quainted with you by this time, know."

Could I believe my ears! Howev I commanded my feelings as bes could, while I said anxiously:

"Tired, my peerless one? W has occasioned so distressing a cat rophe?"

"Don't use such extravagant pressions!" objected Gladys cro

"Fatigue is quite a commonp sensation, I am sure. I have been riding all the afternoon with Mr. S ers."

"With Mr. Sellers!" I echoed, f ing as if a bombshell had explo beneath my feet. Sellers had b one of my most formidable riv and over whom I had felt very e tant. "Out riding with him?"

"Most assuredly," was the cool r ply. "What are you looking so tonished about?"

"My dearest love!" I said, b ning to feel considerably perturb and not a little hurt, "you sure would not be willing to cause me t wretchedness, in the present state our relations, of encouraging the a tentions of—"

"Fiddlesticks!" interrupted Glady "Mr. Sellers and papa are old friend and George and I have known eac other since we were children. I don see any reason for treating him like stranger. By the way, he will be the hop to-morrow night, and I hav

promised him three dances."

I shut my eyes and groaned. Three dances! I must be compelled to stand and witness my affianced being whirled about the room in the arms of another man! Visions of pistols and coffee floated before my disordered brain; then recovering in some measure my normal condition, I endeavored to expostulate with my angel, but in vain; and I was obliged at last to desist, and finally took my leave, exclaiming after the fashion of the little old apple-woman, "This surely can't be I!"

When I called the next evening, however, to take Gladys to the hop, she looked so entrancing in her ball costume, and received me so graciously, that I was more than ever convinced yesterday's experience was a delusion, and wisely forebore any reference to it. I was quickly brought to my senses, however, when we reached the place of the festivities; for as I entered the ballroom, proud and happy, with my angel on my arm, we were met by Mr. Sellers, who immediately wrote down his name on her tablets for two waltzes and a quadrille. That was quite enough to spoil my enjoyment for the evening; moreover, Mr. Sellers was not the only one who obtained the privilege of dancing with her. Heretofore at these festivities I had enjoyed the exclusive right to her society; now I could only look on while her bright smiles and gracious attentions were showered upon others, and she seemed to quite forget that I was present, or had any special claim upon her. She did not absolutely ignore me, however; and as with my arms around her I whirled down the room in the last and best waltz of the evening, realizing that all this loveliness was mine, I grew almost happy again. But when I had seen her home, and in the solitude of my own room was reviewing the events of the evening, recalling the bright glances and smiles I had only shared with others instead of monopolizing as formerly, I felt the altitude to which my enraptured fancy had raised her diminishing, and my extravagant estimate of her angelic qualities decidedly shaken. And when next day, from force of habit, I wrote my customary letter, I found myself insensibly dropping the extravagant—I could see, now, that they were extravagant—expressions with which I had been wont to clothe my sentiments.

Several weeks passed under this new regime, and although so far from alienating my affections, it increased them tenfold, my idolatry of some matchless divinity changed to a deep affection for one who, notwithstanding, I began to recognize as a really infallible mortal. Still, as I found her almost invariably surrounded by visitors, whose society apparently afforded her as much entertainment as mine, I resolved to come to a distinct understanding as to our future relations. Making my visit at an earlier hour than usual, I was relieved to learn that she was at home alone. Stepping into the parlor, I sent up my name, and with a nervously palpitating heart, awaited her coming. When the door opened I rose to meet her, grave and quiet.

"Oh, it is you, Arthur!" she exclaimed, with an accent of surprise, as she extended her hand. "I could not think who it was come for such an early call."

"Yes, it is I, Gladys."

I had almost unconsciously dropped, of late, all the extravagant similes and endearments with which I had been accustomed to embellish my speech when with her; and, moreover, contented myself, on this occasion with a quiet pressure of the warm little hand in mine, instead of raising it dramatically to my lips, as I would have done a few weeks earlier.

"I came early on purpose to see you upon a matter very serious and important," I said.

"Serious and important!" Her pretty face was very grave and demure as she echoed my words. "Well, sit down, and let us hear what it is."

"Gladys," I began, trying to speak very bravely and sternly. "Some months ago I had the happiness to know that I stood first in your regard, and received your promise to become my wife. Have you grown to think less of me since then? Do you desire to—to—"

"To what?" she asked, with an air of innocent wonder, that made me want to kiss and shake her at the same moment.

"To cancel our engagement!" I finished desperately.

"Why, what makes you imagine that?" she exclaimed, opening her blue eyes very wide.

"A great many things, Gladys." I detailed the events of the past few weeks. "If I have so signally failed to realize your expectations, your ideal, perhaps I had better—"

"Give me up?" she suggested, with an arch smile.

"It would almost kill me to do so!" I groaned. "But it seems the only alternative left, from present indications."

Gladys cast one glance at my perturbed face, and then broke into a peal of merry laughter.

"So you would rather not give me up, eh?" Well, now, just let me tell you something. You have been canonizing me to a greater extent than I deserve or could possibly acquire, and I wanted to convince you that I was only a very ordinary mortal, and just as likely to do all sorts of outrageous things as my sister sinners. Now, if you will promise not to think me an angel or anything so superlatively supernatural, you'll suit me splendidly, and we'll get along ever so much better than we could possiblly do otherwise. What do you say?"

What could I say? I was enlightened now with a vengeance, and could only sit and stare at her.

"You know very well that I love you, you dear old stupid!" said Gladys, sitting down beside me, and slipping her hand coaxingly into mine. "But the case was growing desperate, and I could think of no other remedy. Will you take me just as I am—no worse, no better—and not cumber me with a list of poetical, but quite impossible perfections?"

"I'll take you on any terms, and be thankful for the privilege!" I exclaimed, catching her in my arms with a hug that compensated for all I had suffered. "Only before I let you go, you must set our wedding day."

She did after some coquettish demur; and when, on that happy occasion she raised her lips for my bridal kiss, she whispered rogouishly:

"Now, Arthur, remember I'm not to be considered an angel, or anything of that sort!"

"No, you little witch!" I answered, drawing her close. "Not an angel, I admit; but next door to one!"—Journal of Agriculture.

Seventh
Home
Extension

The location of our Seventh Colony is 7 to 12 miles south of the City of Bakersfield. It is

Kern Island
Land

and only

$25 an Acre

You can but down your own well (flowing artesian) or buy water rights from Kern River canal at only $20 an acre.
It is ready for your plow right now and is a wonderful bargain.
Send 5c for Illustrated Booklets, Maps, etc.

What a Liner Will Do

Please discontinue our advertisement in the California Cultivator. Send us the bill for amount due.

The results have exceeded our expectations. The liner we inserted sold nearly one hundred cows, heifers and bulls. Most of these were for our neighbors.

Yours truly, Tribble Bros.

POULTRY

WHITE WYANDOTTES—"CREAM OF THE Coast" strain—the 200-per-year kind. Barred Plymouth Rocks, my "Blue Diamond" strain, are great winter layers of big, brown eggs. No incubator lots furnished. Eggs per 13, after Jan. 1, carefully packed, $1.50. Address WILLIAM C. PARKER, 111 Pacific avenue, Santa Cruz, Cal.

GERMFOE KILLS THE GERMS—GREATest disinfectant known. Sprayed about it prevents disease—a few drops better than a pound of cure. Large bottles 50c, or smaller bottle by mail prepaid same price, if your dealer hasn't it. Diluted with 50 to 100 parts water, a little goes a long way and costs but a trifle. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

EGG-MORE, THE GREATEST OF ALL "egg-makers" and the biggest seller. Highly concentrated though not a strong tonic and stimulant. A little daily with the feed does the business. A 25-lb. $2.00 pail for $1.50, if you haven't tried it; freight prepaid by us, if you name this paper. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

ALTADENA ORPINGTON FARM—MATSON Hayden, Box 1001, Pasadena. Golden Buffs exclusively; fine male birds a specialty. Settings $10.00 and $5.00. Five winnings at show in Los Angeles, 1908. Satisfaction guaranteed.

BUFF ORPINGTON DUCKS, THE GREAT commercial bird; good for market; great layers. Eggs now $3.00 per 12; $5.00 per 26 from our imported English blue ribbon strain. GOODACRE BROS., Compton, Cal.

DAYTON'S ROUP TABLETS ARE GUARanteed to cure or money back—not talk back—money. 50c by mail if your dealer hasn't . WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

KILLAMITE KILLS THEM—BEST INSECT powder made for fowls or plants. 50c for 2½ lb. sifting can, express prepaid by us if your dealer hasn't it. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

FOR SALE—MAMMOTH BRONZE TURkey hens, $2.00 each if bought in lots of ten. Address, Mrs. W. B. RICHARDS, Holtville, Cal.

WHITE PLYMOUTH ROCK SILVER CUP winners at the big Chutes Park show, January 6th to 12th, 1908. Eggs, $2.50 and $2.00 per 13. Average score of first pen 95½. ADAM BANKIN, 271 Isabel St., Los Angeles, Cal.

FOR SALE—BLUE ANDALUSIANS, A FEW cockerels and two or three trios. Eggs later. J. H. WALKER, Olinda, Shasta Co., Cal.

WEST COAST CHICK FEED MAY COST A little more, but you can't afford to feed the little ones anything but the best. Of dealers, or $3.50 cwt., f. o. b. Los Angeles. WEST-COAST MILL, 818 San Fernando St., Los Angeles, Cal.

BLACK-TAILED JAPANESE BANTAMS: winners wherever shown. A lot of good youngsters at $5 and $7 per pair if taken soon. Eggs $2 and $3.50 per 15. F. J. IRONMONGER, 127 N. Garfield Place, Hollywood, Cal.

INDIAN RUNNER DUCKS AND BLACK Langshan fowls. Eggs and stock for sale. Large, fine stock, with good range and strong fertility. CLYDE J. MOSS, Corona, Cal.

ARROWHEAD STRAIN BARRED ROCK eggs—$2.00 per 13. MAX JENNEY, 6526 Pollard St., Los Angeles, Cal.

Hay.

ers & Co. say:
the face of a very discouraging
narket, shipments of hay have
increased during the past week,
arrivals amounting to 3380 tons in
arison with 2920 tons last week
130 tons for the wek preceding
The only feature of the market
e moment is its dulness, for
is quiet and nothing has devel-
in the way of an increased de-
to afford any stimulus to the
et. We have had quite a period
y, cold north winds, which is
ng some little apprehension
gst the farmers, but as no dam-
as been done as yet the market
een in no way affected.
S. F. hay market stands a bit
e when being considered with
lines of produce, for prices are
lished here from day to day ac-
ng to each day's supply and ut-
regardless of crop prospects or
ry stocks. When the daily sup-
does not equal the demand, either
use of an unusual consumption of
here or the general holding back
ocks by those who fear a crop
re, then we have an interesting
et here and improved prices. The
market is peculiarly sensitive to weather conditions and trade outlook, but hay is regulated on its own peculiar day by day basis.

Merchants in all lines of trade in S. F. are complaining of lack of business, so very little of interest can be reported anywhere. With the renewal of loaning operations on the part of our Savings Banks, which it is anticipated will be in effect within the next 30 days, all trades should be stimulated, and it is hoped that then the hay market will share in the general improvement of conditions.

Citrus Market

LOS ANGELES, Feb. 19, 1908.

The tone of the orange market is somewhat easier. Eastern weather conditions are not favorable to handling the fruit and the "second crop" Floridas are something of a factor. But as the percentage already shipped is much greater than last year no concern is felt.

The quality is unusually good, though occasionally a "puff" has been found and some fear that early puffing may follow.

Lemons are also easier, partly because of weather conditions and partly because of large receipts of foreigns. It is thought that the next 30 days will see this large stock reduced and prices normal.

Shipments.

Shipments of citrus fruits to date are 7930 cars, of which 1260 were lemons. Last season same date 6548 cars, of which 814 were lemons.

NEW YORK, Feb. 17.—Thirty navels, three lemons, two mixed, one budded, one California Bright sold. Navels easier, slightlly lower. Large portion of offering spotted and stained. Lemons in good demand. Weather clear and favorable.

A RELIABLE CONCERN.

A cheap horse is liable to be a poor one, and the same is true, even more liable to be true, with nursery stock. The Placer Nurseries, located at Newcastle, California, of which Silva and Bergtholdt Company are the proprietors, believe in placing only the kind which will be a credit to their established reputation. Messrs. Silva & Bergtholdt have sold deciduous trees from these nurseries for many years, and this year are offering an exceptionally fine stock of strong, thrifty, well rooted trees. They informed a Cultivator representative recently that the year appears to promise extensive planting, and the choice trees are being rapidly picked up in all nurseries of the State. It would surely be advisable for Cultivator readers who contemplate planting deciduous trees this season to get busy at once and secure their stock. We believe there will be no more reliable place to secure these trees than the above mentioned nurseries. On another page may be seen a list of many of the valuable offerings which the Placer Nurseries have for this season.

West Coast Cresol Dip

Strongest and most effective Germ Destroyer, Insecticide and disinfectant. Made of Coal Tar Creosote Oil. Great caution must be exercised in using Carbolic Dips and those that contain Petroleum oils. Reports in 1905 from Wyoming show that many sheep died on account of dipping in petroleum. Sulphur-Lime dips impair the quality of wool on sheep, and sometimes blind them. Tobacco dips very often sicken sheep. And none of these dips can compare in effectiveness with Cresol Dips. These, while being most effective, are perfectly harmless. Wool is improved by their use, as it not only cleanses the wool but leaves no stain and gives it a soft texture.

But Cresol Dips differ very much. A Coal Tar Dip depends for its activity almost entirely upon the Cresylic Acid it contains. West Coast Dip is guaranteed to be made from Coal Tar Creosote Oil containing 25 per cent Cresylic Acid. Most dips sold in the United States are made from domestic creosote oils, which run about one-half the strength of imported oil. Permission was given by the U. S. Dept. of Agriculture to use our Dip for the treatment of sheep scab in the proportion of one part Dip to 67 parts water. This is the highest dilution we have ever heard of being permitted by the Department. When thus diluted it costs but a trifle.

For sale by many dealers. If yours does not keep it, send direct to us for trial offer, "special price and freight prepaid."

Pumped by
The New Pomona Deep Well Pump Head

Pomona Mfg. Co., Pomona

Riverside, Cal., October 8, 1907.

POMONA MANUFACTURING CO., Pomona, Cal.

Gentlemen:—In reply to yours requesting privilege of photographing our pumping plant which you installed for us last spring will say: You are perfectly welcome to take as many photos as you wish, and as our season for pumping is practically over, it may be of interest to you to know something of what we have been doing with it. We have raised forty inches of water about two hundred and fifty feet, delivering it through a six-inch pipe line to our reservoir about one and one-half miles distant from the well. The pump is driven by a forty-horse power electric motor, and our tests have shown the actual horse power used to be twenty-seven horse power. The pump has worked perfectly all through the season and is in perfect condition today. It has come up to all that you represented it and met our every expectation. Should you wish to refer to our plant at any time, you will always find it open for your inspection. Yours truly,

ertile Fields of Stanislaus County

The Introduction of Water into Stanislaus County Has Made Productive Thousands of Acres Which Before Produced Nothing, or at Least But Little in the Form of Grain

WHOEVER goes to Stanislaus county will find that their slogan is, "Water is wealth," and their boast and pride is the great diverting dam at La Grange, a picture of which appeared in last issue. It is said to be the largest structure of its kind in the world, being 129 feet high, 310 feet wide, 33 feet thick, of solid masonry, and is for the purpose of irrigating 268,000 acres. The completing of this great system has brought great wealth to Stanislaus county, and many settlers are now going there to increase its prosperity.

Fruit growers in that county successfully substantiate their claim that oranges grown in that county ripen for the Thanksgiving holiday trade. Steps are being taken to form a citrus growers' association, because of the increasing acreage that has been, and is being, planted to these desirable and profitable fruits.

THE vineyards of Stanislaus will be the means of bringing many thousands of dollars to that section. Both table and raisin apes have done well

A growing industry is the celebrated Caliyrna fig, the well known fruit of commerce. is proving quite a success, being delicious, th in the fresh and in the dried state.

It is proving to be an ideal county for dairyg, having progressed from the twelth to the rd place in that industry in this State. Many perienced dairymen from Northern, Central d Southern California have moved there th their fine herds. There are good creames at Modesto, Newman, Oakdale, Ceres and rlock, and the butter fat commands among highest prices paid in the State. It goes thout saying, that with green feed the year ind, and an even climate, poultry does exdingly well.—J. W. Webb, Secretary Stanius County Board of Trade, Modesto.

e Principles of Plant Breeding

An Address by F. W. Power of Salem, Oregon, Delivered at the Last Session of the Oregon State Horticultural Society

probable that no branch of the nursery
ess is so much neglected as that of selec-
and breeding to secure new or better
of old varieties of fruit, or to secure new
roved varieties. The same might be said
al truth of the horticulturist or grower.
ot at all unusual to have a planter say he
is or that type of a variety, as a yellow
ction from a green one, or he wants red
s. and the same kind of questions regard-
ries, pears and other fruits. That there
excuse for such requests, there is no
Different sections or localities often
a decided change in the form, color or
qualities of fruit, and sometimes
new type.
ies often do not use as much care in se-
he best types or strains of each variety
should, one reason for this being that
nters are unwilling to pay any more for
ree of the choicest strain of any variety
an inferior tree of uncertain type.
) trees are, therefore, often grown in or-
neet or undersell competitors. Again,
en are often perplexed as to where to go
the choicest strains of a variety, as so
erest has been shown in this by the
and growers. In the third place, we
many varieties in our nurseries. It is
e for any nurseryman to grow 500 to 700
varieties of fruits and as many or more
of ornamentals, and to grow these 500 or
ties of fruits on the various roots and by
nethods to suit the planters, having often
his catalogue from 1500 to 2000, and to
y select all scions or even have his fore-
so he must depend to a certain extent on
er and others to supply these scions, and
he nurseryman who secures scions not
ame or of an inferior strain and happens
them out without discovering it by the
ks of the tree or leaves in the nursery

s no doubt that much improvement
made in many of the old varieties by se-
ions for a number of years from the
olored, best bearers or longest keepers,
ing them in selected stocks or seedlings.
a chance for the progressive grower to
a new line, and, by selection of scions of
best strains and making the fact known,
large part, if not all, of his pruning ex-
the sale of scions. Do not understand
nat great improvement can be made in a
ection.

Stock.

ow approaching dangerous grounds with
esrymen present, and if in a nursery-
vention would likely bring some of the
to their feet at the close of this paper.
mention pedigree nursery stock to the
urseryman, he will ridicule the idea,
o think that pedigree stock means one
cestry can be traced back for hundreds
as in the nobility of Europe, while a
a "pedigree" of over one hundred years
one of the poorest varieties in exis-
s I use the word here, pedigree trees
of a known type or strain, of good qual-
have been selected for some certain
stics—as color, quality, keeping, etc., whether for a long or short time, provided the results have been secured.

Now, I do not wish to be understood to infer that all variation in varieties comes from the scion, not by any means. As great variation occurs through non-selection of the stocks or seedlings on which they are budded or grafted. This is even a harder problem for the nurserymen than the selection of scions, for as we all know, any fruit tree from seed varies greatly, and to raise stocks at reasonable prices without using unselected seed is nearly impossible. When planters are willing to pay the added cost of selected stocks and scions I think you will find the progressive nurserymen only too willing to grow them in this manner. As nurserymen we must, therefore, either admit that we do believe, at least a little, in the scientific theory of selection of stocks and scions, or else that our well written circulars, advertisements, etc., are merely written to catch the "sucker" who plants.

I will not attempt to go deeply into the scientific side of this subject as I do not consider myself capable of doing so, nor would it interest the majority of those present if I did, but that varieties can be improved or adapted to new conditions and new and improved varieties produced by cross-breeding and selection there is no question. I do not claim any original work in this line, but make the suggestions from reading various authors and observations of results obtained. Personally, I am a firm believer in cross-breeding or hybridizing, rather than by mere selection.

Plant Breeding.

Plant breeding virtually commenced with Van Mons, in Belgium, and Knight, in England, a little over 100 years ago. Van Mons was the first to propound a complete theory or system of the philosophy of the origination of cultivated plants and applied especially to fruits. This theory was in the form of five laws, which for the most part are admitted today. These five laws as stated by Bailey from the writings of Poiteau are:

1. A natural species of tree does not vary through its seedlings in the place in which it is born; so long as it remains in its natal place, it produces only the plants which resemble itself, or, at most, only sub-varieties.
2. The causes of variation are a change in soil, climate or temperature.
3. Whenever a natural species of tree produces one or many varieties, these varieties continue to vary always, if they multiply by means of seeds, without ever being able to return to the primitive form.
4. The source of all variation, which is transmissible by sowing, resides in the seeds.
5. The older a variety of fruit or other tree the less the seedlings vary and the more they tend to return towards the primitive form, without being able to ever reach that state; the younger or newer the variety, the more the seedlings vary, or, as we might say, the better the variations are for the use of man.

"The student will observe that there is little in these statements to challenge controversy, save only the last or fifth law—that seeds from old varieties tend to give small difference in seedlings, and that these differences are usually in direct inferiority; being reversions toward primitive types; and that on the contrary, seeds of new varieties give wide variations, which are usually in the direction of improvement. It seems that this particular doctrine to which we now restrict the name—'Van Mon's theory'—was not originally deduced from observation, but from precognition not founded upon experience and practice, but which he endeavored by every means to verify and develop."

Knight, his contemporary, on the contrary, began a thorough study of nature, but never arrived at a general theory. He had hypotheses for minor problems.

While plant breeding and selection today are only in their infancy and but comparatively little scientific work has been done along these lines, until very recently, still many new and valuable varieties have been bred or selected by a host of men among whom we might mention Van Mons in pears; Knight in cherriees and other fruit; Adlum and the catawba; Bull and the Concord; Munson and Rodgers and various grapes; Dr. Nilson, director of the Swedish experiment station at Svalof, who has probably accomplished more in the improvement of varieties of grains than any other scientist; Hays of Minnesota (now of the department of agriculture) in grains; Webber, late of the department of agriculture, now of Cornell, and Swingle of the department, in citranges (a cross of the lemon, orange and trifoliata orange in trying to secure a hardy citrus fruit for northern climates,) also in pineapple hybrids and other fruits; Hansen in his work with plums and other fruits suitable for the colder sections; Van Deman, Galloway, Brackett, Eissen and others of the department of agriculture, in helping to introduce breeding or selecting of new and promising varieties such as the avocado, Yangtow, etc., etc., and improved varieties of cotton, tobacco, durum wheat, Japanese persimmons plums, figs, pecans, pistachio nut, grapes, etc., etc., Burbank, in our adjoining State, with his almost numberless new varieties and species of fruits, flowers, nuts and ornamentals; the late John Rock, who probably did more to introduce improved varieties of the French walnut to this coast than any other man, besides taking great interest in various other new or promising foreign fruits; Roeding in conjunction with the department of agriculture in introducing and in the propagating of the Smyrna fig; MacDougal, Castle, Davenport, Morgan and others in scientific experiments and writing on breeding and selection; the works of Downing, Thomas, Mechan, Barry and others in horticulture and plant breeding; De Vries, of Holland, by his experiment in plant breeding and his writing and lectures on the mutation theory and breeding.

Along the same line we should mention the great work being done by our experiment stations and by the U. S. Plant Introduction Gar- new foreign varieties for testing and distribution.)

We need more good varieties for adaptation to different climates and soils. No variety can claim to be adapted to a different soil or climate until it has been tested under similar circumstances. We need more variations, strains or types of our well known varieties for adaptation to varying conditions of soil or climate. The Newtown pippin apple, while one of the best quality, is only adapted to a few localities, and the same can be said of many others.

Deciduous Fruit Cultu

WINTER CONTROL OF INSECT PESTS.

SOME years ago the Department of Agriculture at Washington, gave a list of about fifty insects which are injurious to farm crops. This was not a complete roster of such pests, of course, for had it been complete, the list would have included hundreds of names. Only those which had been specially injurious during the year were mentioned. The entomologist department of the Colorado Agricultural College has made a careful examination of this small group of the worst forms, which shows that no effective method of destruction has been found for half of them, except such measures as are used in general farm practice, writes S. Arthur Johnson, Associate Professor of Entomology, State Agricultural College, Fort Collins, Colorado.

The first thing of importance on the farm is clean culture. Very few injurious insects live entirely upon the crop that they infest, but find food on other plants similar in nature. The potato beetle, for example, finds its native food plant in the bull nettle, and often lives upon other plants of a similar nature. Other insects breed upon common weeds and are thus always more or less abundant and ready to infest the crop when it is planted. Thus the sugar beet web-worm lives upon many common weeds, especially lambs' quarters and sometimes becomes so numerous that it migrates into adjoining crops.

All insects live through the winter in some stage of their existence, and a knowledge of their condition in this stage is a great help in farm practice. Adult insects must hibernate somewhere, and the place most commonlly selected is a secluded place where changes of temperature will not be too rapid or frequent. Rubbish of all kinds forms go

are excellent eating plums of the Japanese type. Cherry plum and Wayland are good plums of the American type. Sultan and Satsuma are blood plums that are excellent for jelly and canning.

Peaches.

Peaches are a favorite fruit and, fortunately, we have an excellent list of varieties that cover the season from June till December. We would recommend the following, ripening in the order named: Sneed ripens about ten days earlier than Alexander. Admiral Dewey follows and is a yellow free stone of good quality. Yellow St. John is a finely flavored peach that will not stand handling even for the local market, but is excellent for eating fresh from the tree. Large Early York is one of the best flavored peaches grown. Cooleys Favorite is equal to it. Wiggins is of the same type and a little later. Foster and Elberta follow and carry the season well into the late summer. Salway is, perhaps, the best late peach now on the market. It is not agreeable to eat out of hand, but sliced for the table is good.

There are a number of very fine midsummer peaches that are not found in the catalogue, because there is no call for them in sufficient quantities to warrant keeping them in stock. Stump the World and Belle of Georgia are of the class with white and red streaks just beneath the skin. This strain of peaches cannot be equaled for fine quality.

For home canned fruit, Foster for freestone and Old Mixon cling for the cling, and good. The yellow class such as Phillips' and Orange the cling, are good. The yellow culiar peachy flavor of the other two. Chinese Cling is excellent and much larger than Old Mixon, but is a shy bearer.

Figs.

Most varieties of figs sour within forty or fifty miles of the coast, in the southern valleys and also in many northern localities. There are a few varieties that are not affected this way, or at least have not proven so at this time. Rond Noir is a large, dark brown fig that ripens early. Angelique is a delicate amber colored fig that follows and Negro Largo and White Datatto are good black and white figs respectively that continue late into the fall.

Grapes.

The following list of grapes ripening in the order named will give grapes throughout the whole season: Chasselas Rose, Cinsaut, Olivette de Cadanet, Muscat, Muscatello fino, Verdal, Damascus, Lady Finger and Cipro Nero. All but the first two named and the last will grow well on an arbor. Golden Queen is an excellent late grape and a prodigious bearer. It is a good arbor grape.—J. W. M.

A Grass valley farmer cut open the craw of a quail the other day and after carefully counting found nearly 500 insects, the majority of which were harmful to his crops. It stands to reason that no kind of bird will live entirely on harmless insects. On the contrary, nature has wisely planned that the birds should subsist largely on the insect enemies of the farmer. Yet the farmer permits them to be slaughtered by thousands, truthfully remarks the Moro Observer, while he rushes off into lawsuits if a railway train runs over a $2.50 pig or a hunter shoots a $6 calf.

Not Connected With Other Stores

Intelligent Buyers
Appreciate Our Methods

Stores using the sensational special reduction and great discount methods are often considered low priced, while stores transacting business on a straight price system are assumed by many to be high priced. A little careful consideration will show you the error of this assumption and convince you of the advisability of buying under our system of pricing and selling, furniture, carpets and draperies.

Our Store Is the Low Priced Store

We have but the one price for all and that price is as low as it is possible to sell good qualities. If furniture is originally priced right there can be no special reductions or discounts. Stores employing such methods must price their goods high to provide for the great reductions. Such stores must then be high priced and you are paying much more than the goods are really worth. Our every day, plain figure prices are the right prices and are lower than you will find such goods priced elsewhere. We have the largest and finest stock on the Coast.

With the Citrus Growe

ORANGE CULTURE.

During the early history of orange growing in California, it was generally considered good practice to plow and cultivate shallow, and many groves were cultivated in this manner. Other growers practiced deep plowing and cultivation, and as time went on, both classes of orange men had their trouble with soil and with orange trees out of order. Many reasons were attributed as the cause of this. Some of the groves which had been continually cultivated but a few inches developed a hard layer of soil just below the surface mulch. In this hard layer and directlly beneath it, were the great bulk of the roots of the orange trees. When groves in this condition were plowed deeply and the hard layer with its many orange tree roots was broken up an immediate improvement in the. trees were noticeable. Trees that were severely root-pruned in this manner sent out a new system of feeding roots near to the surface; in consequence, a more healthy growth was developed in the tops. The results thus obtained were usually attributed to the formation of a new root system. This was really not the case.

The inability to get the water into the soil was the chief cause of deterioration. This was quite evident to many and a stampede for the use of the subsoiler followed. This served its purpose well on soils subject to formation of "hard pan" below the plow, and in many cases was used to an extreme. Trees growing in a light, sandy soil, which takes water readily and retains it, is not benefited by subsoiling. This is proof enough that it is not a new system of roots that degenerated trees need so much as it is a more thorough and uniform moisture supply.

Inducing Deep Rooting.

It is a well known fact that the depth to which orange tree roots grow may be influenced by the treatment given them from the time they are planted. This influence seems to be slight, however, and we have never seen a case where the increase in depth of root development was very marked. The Florida sour orange is naturally a deep rooting variety, still some specimens have both the deep and shallow system on the same tree. This is not due to any particular treatment, but is the nature of the tree.

Deep plowing and cultivation and thorough irrigation has a tendency to develop some roots several feet below the surface, though it is perhaps the deep irrigation that is almost exclusively responsible for deep rooting.

One prominent orange grower in Riverside has adopted the plan of running the irrigation water close to the young trees and keeping the spaces between the rows dry on the surface. The percolation sidewise and downward fills the lower stratum of soil and leaves the upper layer dry. We believe more is gained by keeping the entire area occupied by the roots, moist from six inches of the surface down.

The Richest Zone of Soil.

When the upper six to ten inches of soil are kept loose and continually stirred throughout the season, no orange roots can become established there. When it is allowed to dry, no roots will grow there, it is moistened and remains turbed, then the orange root grow in abundance. It is n moisture that draws them ther other things being equal, the tions that best suit the orange are found within two feet of th face. Even when a uniform sup moisture is present to a depth to fifteen feet, fully 80 per ce more of roots are found betwe inches and two feet of the surfa

This condition cannot be di in the case of groves on sweet pomelo roots, and if they ar coaxed down by a uniform and cient supply of moisture, we seek some other method if we w force them down. The plow an tivation are efficient only as de they penetrate. The orange ravenous and rapid feeder an roots seek the moist, fertile The roots will approach the s in abundance, as close as the cu tor will allow them, moisture c tions being equal. This shows natural tendency of the sweet o root, and we are opposing n when we try to force the roots d It is a well known fact that the fying agents in the soil are abundant in the zone occupied b ange roots than at a greater dep

(To be continued.)

BE EASY.

One of the coming industrie Santa Paula is the production of died citron. Mr. Carter, one of citizens has succeeded in produci superior article of this well-k and expensive fruit. Our climate soil is admirably adapted to growth of the trees and fruit the profits are enormous. About trees are planted to an acre and are continuous bearers. The weigh from one and one-half pounds each, and a very conse estimate by one of our leading growers was two hundred poun tree or 20,000 pounds per acre the present retail price of 35 c per pound, the product of one will amount to $7000. We are sured that sugar will be the pr pal item of expense in the pr tion of citron and that the mos that retained in the fruit and so a good margin of profit. The fruit be produced as cheaply as lemons with the same cultivation and car

The discovery of the method o ing the fruit was discovered afte eral months of experimenting b Carter, and comparisons of citron served by him with the imported carried in the local groceries greatly to his advantage. His pr is far superior, both in flavor an pearance, being both lighter clearer.

A company is a probability o near future which will be org for the purpose of carrying new industry on a large scale. Paula Chronicle.

Sounds good, but, be carefu easy, now, till a little cold exper verifies some of the above figur is possible that $7000 may be r all from the product of one acre, bear in mind there is "sugar"— some other things—to be consider

We do not think the citron orcha of Riverside and Monrovia have b astonishingly successful. They h produced the fruit. The fruit has b made into a fine article, but in the rious turns the coin has not b plenteous enough to prove embarr ing to the growers.

The Cultivator has no desire to courage enlarging our capacity to p duce citrus products. On the c

ʼ it hopes they may be enlarged the sale extended constantly.

ıt we do not believe a $7000 (less tle "sugar") per acre claims ns should be set before a prospec- planter. Cut off a cypher—maybe of them. Then if the grower gets ʒ than that it will look better to than if he starts in with $7000 ex- ations and $7 or $70 realization.

HAVING TROUBLES.

ɔrida is having her troubles with rest of us. On the marketing tion we recently noticed in the ida Agriculturist the following:

a Conspiracy?

e do not make the charge, posi- ly, but some things which are ›ening have very much the ap- ance of an organized effort to k down the market price of Flor- oranges. The tremendous rush reen fruit early in the season de- ılized the market to such an ex- that many buyers have lost con- rable money. Have they com- d to recoup themselves by break- the market to such an extent that may be able to buy up the re- ıing crop at figures which will v them to recover their losses n they sell on the rise which is to come? There are many cir- stances which give color to the estion. We have heard a report Florida oranges have been sold ew York for as low as 40 cents x. If so, it must have been that fruit was not in good condition. of the trade papers reports that lot of Florida oranges, containing boxes, was in such bad condition it had to be repacked and the re- was that only 100 boxes of fruit left and that by no means first . Such decay can only be ac- ted for on the belief that the was not properly handled. There ıo doubt that oranges can be ɘd, packed and shipped without ›us loss from decay.

has always seemed a great pity s that the old Florida Fruit Ex- ge could not have been revived. ad its enemies; no organization l possiblly expect to satisfy every ›mer, and as the managers were an they do doubt, made mis- s, but we have always bellieved they honestly tried to work for good of the orange growers. In it would have been very foollsh hem to have done otherwise as could only prosper when their customers were also doing well. Is it not possible to organize an association which sould have its headquarters at Jacksonville and thus be so situated that it could not be accused of favoring one section more than another?

GUM DISEASE.

This is one of the most destructive diseases that threaten the industry and must certainly continue to spread and destroy trees as they become older unless stringent measures are taken to check it as has already been done in some sections where it has threatened entire groves. There are many quacks in the field selling patent dopes to cure this disease and they should be given a scant hearing by growers who are seeking permanent results. Exhaustive tests are being completed in the State Pathology Laboratory, and these show that the trouble is not due to any spore, germ or organism, but in every case to physical and mechanical conditions which are nearly always in the soil. Any disinfectant or other dope applied to the wounds is of no value then as a curative measure. What is important in this respect is to remove diseased tissues before they are entirelly dried out and while the sap wood beneath the diseased cambium is still capable of healing over the diseased portions. Now put on a heavy coating of any material you choose that will hold the natural moisture of the trunk and thus facilitate healing. It is desirable that it should contain sufficient disinfectant to prevent saprophytic rots from entering the wounds, but not enough to burn and kill the sap wood beneath, which must be depended upon for healing out the portions removed. I have found groves where this healing was going on beneath a coating of beeswax, and others where a heavy coating of coal tar was answering the same purpose. Many object to the oils of tar and will probably prefer the beeswax preparation which is made as follows: Three parts of beeswax, one of resin, a little linseed oil. This combination is quite cheap and is nearly transparent. It must, of course, be applied while warm. A heavy plaster of fresh cow manure bound about the trunks is also very satisfactory, if a sufficient amount can be obtained.

The gum disease situation in some of the worst affected districts is very hopeful and it is largely due to drainage, exposures of bud unions, and a thorough spading of the soil about the trees directly after the rainy season, and as often as it is necessary to prevent it from baking and becoming hard, at the same time allowing air to penetrate to the feeding roots and prevent the soil in which they are embedded from scouring, this is probably the most important factor of all. While conditions producing this disease here are not entirely analogous to those of other sections, especially in the matter of under drainage, yet there is much to be learned from their work. No other cause is at once so vital and difficult to overcome as lack or drainage, and I believe that the difficulties here can be even more easily and effectually surmounted than where this is the chief cause. Much work has already been done here and much of it promises to be very satisfactory. It should be extended to every grove where this disease occurs and every possible effort should be made to remove the cause of it before spring, for it is usually then that new cases appear and the old ones spread about the trunks. Where it is necessary to dig down to expose the bud unions, the basins thus made should be filled before they collect rain water. White sand or other sand free from clay is best for this purpose. If desired it can gradually be worked into the soil and thus make it much lighter and less susceptible to the disease.

As usual preventive is better than cure, and it must become a part of field practice to remove and prevent causes before the disease appears, for a diseased tree is not easily reclaimed to its full bearing capacity. I say "prevent" causes from occuring because I know of cases in this very association where gum disease has been induced, especially in border rows, on light soils by basin irrigation. Water is certainlly not more valuable than trees and should never be allowed to come into contact with the trunks, much less to be held about them.—From report of Field man Jones to San Dimas Lemon Association.

ORANGE VINEGAR.

Orange wine has been tried, and has been found wanting as a solution of the orange cull question.

Riverside was recently visited by an experienced cider and vinegar maker from the East, who has been in the habit of running mills with a daily capacity of from 300,000 to 400,000 pounds of fresh fruit, used wholly in the manufacture of fruit cider and vinegar, using something like 5000 to 6000 boxes of orange culls per day of 24 houds. Such a consumption would clear the situation quickly, and it is this gentleman's opinion that the radical cure for the cull trouble is to be found in the establishment of orange cider and vinegar works in the best center of the orange growing section, where the greatest amount of culls can be teamed direct to the mill from the groves without having any freight to pay. Those who have the privilege of tasting the delicious orange cider and vinegar which was exhibited at the centennial fair at Chicago, in the Florida section, will remember the delicious and incomparable article. This was done by the advice of Mr. Labonde, who acted as counsel for the Florida commission, and it was a striking success. Here at home some have had the good fortune to sometime have a taste of this delectable luxury, a drink fit for the gods, as Riverside orange cider is sometimes served at the Hotel Glenwood. If this article was an article of commerce to be bought by those wishing it, every traveler of note stopping at our hotels would become lasting customers. Many rich men and women who love the golden fruit cannot eat it because the pulp is, in cases, indigestible, and often is the source of great distress, to avoid which abstinence from this delicious luxury is the only course; but let the delicious nectar be extracted in its pure natural state, and placed at the disposal of all the well and sick men and women of wealth in the country, and a new era will have dawned for the orange industry.—Riverside Enterprise.

SELECTION AND BREEDING IN HORTICULTURE.

Continued from first Page.

Note the change in our plums in the past twenty-five or thirty years since the introduction of the Japanese sorts, especially in California where the Japanese types and hybrids are now far in the lead as commercial varieties.

Variations.

No two things are exactly alike. No two Baldwin trees are exactly alike; no two branches or even two twigs or two leaves on the same tree are exact counterparts, but for all practical purposes from a horticultural standpoint, any number of trees can be propagated by budding or grafting from a known strain and produce fruit near enough alike for all commercial purposes, and many nuts will produce nearly true to type from well selected seed.

Variations, and often new varieties, occur through cross-fertilizing or hybridization; variations also occur through changes in climate, temperature, soil, cultivation, etc., that go to make up environment.

Mendel's Law.

Nothing in a scientific line has been discovered in the past generation (and I might nearly say all time) that has made a greater impression or given a greater impetus to breeding than the laws of Mendel, the Austrian monk. When first presented they were not understood or appreciated, and for about thirty-five years his law of heredity or unit characters remained unknown, as they appeared at an unfavorable moment—about six years after Darwin's views on the origin of species. They were apparently never heard of by Darwin or Wallace, the men who could have appreciated their worth, yet they contained one of the very best clues needed for the Darwin theory. A revival of interest in these matters on the part of a few biologists led in 1900 to the re-discovery of the principles of heredity.

While we are all familiar with the fact that changes can be produced by cross-pollination, a short review of Mendel's law might not prove uninteresting to some present who have not read them, and while I do not pretend to fully understand them I will try and bring out a few of his principles of interest to breeders, referring those interested to the various writings on this subject. In the first place, when crosses are made of two characters—for example, of a short and tall variety, one character, as the tall, is dominant, and the other weaker or recessive. In crossing one pair of characters in the first generation all will show the dominant character. In the second generation (usually called second filial generation) there will be three times as many dominant as recessive or the ration of 3D:1R. Of these three dominant, one will be pure dominant and bred true, and two will be mixed dominant and recessive, so that the complete ratio would be:

1 pure dominant.
2 dominant-recessive.
1 pure recessive.

Or, to state the law, "Where there occurs a pair of different characters, one of which is dominant, three possibilities exist," pure dominant, which always breed true; recessive, always breed true; impure dominant, which on self-fertilization or inbreeding give both dominant and recessive in ratio of 3D:1R.

Where there is but one p charcaters it is called mono- dism. When there are two p characters, or di-hybridism, comes more complicated. F stance, if we have tall-yellow with dwarf-green in which w say tall is dominant to dwar yellow to green. In the first g tion all would be tall-yellow, dominant characters of each In the next (second filial gene talls and dwarfs would be i ratio of three tall to one dwar the yellow and green in rati three yellow to one green, make even numbers, if we hav teen plants there would be tall (dominant) to four dwarf cessive;) of every four tall will be yellow and one green, of the twelve talls we have nin yellow to three tall-green. O the four dwarf we will have yellow-dwarf to one dwarf-gree

9 tall-yellow (both dominant.
3 tall-green (dominant of one recessive of the other.)
3 yellow-dwarf (dominant of and recessive of other).
1 green-dwarf (both excessive

Here we have an easy cau failure in our experiment if w pect all the nine tall-yellow to true. Only one of these is fixed will breed true, the remaining are found to throw out new typ that the breeder must save the from each plant separtely. "He then obtain what he wants, and obtain it already fixed." Bre should also remember that ratios will not be obtained ex in his experiments but only app mately, as it is usually impos to tell in advance exactly what acters the pair contains and ma characters may be contained in seed first used, or what is know the "presence and "absence" h eses—the existence of ch non-blending in alternative we can only tell by exp whether we have a pure do character to start with. An In ing example along this line Blue Andalusian fowl whic hibits characters peculiar to "Breeders have long recognize difficulty of obtaining a pure of this variety." No matter carefully the "blues" are se they always throw out "wase two sorts, some pure black, a peculiar white with black spl Careful breeding shows on the age one-half the offspring come one-fourth black, and one white. These proportions at suggest that the "blue" are nant-recessive (heterozyotes,) that the blacks and whites a pure dominant and recessive (zygoes) as they give the ratio

1 black.
2 blue (black-white).
1 white.

Here again experiment with theory. When the blac splashed-white are bred togeth the offspring are blue. Parad as it may sound, the "pure blu" A dalusians are mongrels.

"All possible forms which emanate from a cross between fixed strains appear in the sec generation, provided a sufficient nu ber are grown, and a certain prop tion of each of these forms is alre fixed in the second generatio "Again, since all possible re-combi tions of characters involved in a cross come fixed in a definite prop tion of the individuals of the

tion, it is obvious that the
riglual, parental types, will be
them." Now it is a well
fact that in most cases a
means increased vigor for the
y. But the breeder usually
es at making such crosses for
f breaking up and losing the
ɔle combination of the charac-
ound in the original strains.
el's discovery may reassure
n this head. In three genera-
ie can now produce the paren-
pes, and reproduce them with
ie increased vigor, resulting
a cross." "The less a hybrid

A Great Field.

Hays says: Nowhere else in the world is there so marked a movement to organize for improvement of plants and animals as in the United States.

A great field lies open to the plant breeder. If Mendel's laws prove practically true to proportions and "that all possible types come fixed in the second generation," it will save much time and expense to the breeder. If in three years from a cross we can reproduce the parental type with the increased vigor of the hybrid, there is some inducement to even try and improve our best varieties like Newtown Pippin and Spitzenberg apples, Royal Ann and Bing cherries, etc. Will any one present venture to estimate how much wealth would be added to this State each season if we could produce a cherry equal to, or better than, the Royal Ann, Lambert and Bing, ripening a week or two later so as to avoid all danger of damage by rain?

Some of our leading plant breeders like Burbank (who says "heredity" is the sum of all past experience) claim that they have not been able to secure the relation shown in the Mendel laws, and I think we will all find that certain errors will creep in, not because the laws are not well founded but on account of not knowing in advance just what characters our experimental plants have, and what masked characters, or alternative pairs, they contain about which we know nothing, also from combinations of characters producing unexpected results. They have already explained away a mystery regarding the Blue Andalusian fowls that long perplexed scientists. My opinion is, that the greatest advances will be made in cross-breeding and selection of the best types produced, rather than through slow, natural selection or fluctuations. The mutation theory, while not yet concurred in by many scientists, certainly is a great advance over the old theory of fluctuations. While all new species may not have been produced by mutation, a large number undoubtedly owe their origin to that source, and it is certainly reassuring to the prospective breeder to know that he need not wait for ages to produce a new species.

The olive oil mill at Escondido is having a successful season.

Relieves You of Worry
It Makes Big Crops Certain

Wheat, Rye or Barley make large demands on the Nitrogen in the soil. A wheat crop is often so starved for nitrogen that the effect of the application of a little Nitrate of Soda may be seen in the color of the crop in twenty-four hours.

The Vegetable Garden

PLANTING CANTALOUPES IN THE COACHELLA VALLEY.

MR. A. W. McGill, of Thermal, gives of his experience in cantaloupe growing, as conducted in Coachella valley. Mr. McGill writes from several years' experience in that section:

Raising a good crop of cantaloupes is much like raising a good crop of anything else. It requires good land, good seed and proper cultivation. First, your land must be in good condition, either with or without irrigation. For best results, plow under a leguminous crop. Alfalfa sod plowed under is best of all. Commerical fertilizers are not so satisfactory. Have land well plowed and harrowed two or three times before planting. Under irrigation have it well irrigated. Lay off rows six feet wide. Plant with hoe, ten, twelve or fifteen seed in a hill; get the best seed from the most reliable seed man, regardless of price. Plant hills four feet apart. By making a marker you can mark off three rows at a time four feet apart. By being careful one can plant so that the ground can be cultivated both ways, which is very essential while plants are young. Plant about one inch deep, and a short time before they are ready to come up, go over with a garden rake, drawn through the hills with a lifting motion. This will remove any lumps or crust.

The seeding period is the critical time in the growth of the cantaloupe. It is at this time that it needs close attention or it will receive a setback from lack of moisture from high winds or cold weather.

The roots that develop when the seed germinates go down from the seed, while the stem is pushing upwards. These roots form a support for the plant during the first two or three weeks, for up to that time the stem from the seed root up to the surface of the ground is smooth and white. The second root system starts from the stem about the time the fifth leaf appears. These roots form the main feeders for the plant, for the growth of a hill of melons is insignificant until it feels the impulse of the larger and better root system.

The question of early cantaloupes depends on the farmer in supplying conditions that favor development of the lateral root system. Hoe and cultivate once a week, and when the fourth leaf appears hoe the dirt well up around and under the leaves, and don't be afraid to draw it well up, as too much cannot be said in favor of pressing the dirt firmly, and have it rather moist around and under the young plant at this time. The feeders for the plant are putting out now, and the more of them you get the better growth the vine makes, and the more standard melons you get. In fact, I grew a 1200-crate crop one year, and I had one man in the field nine weeks hoeing, or the equivalent of one man's labor, and my succes was due to thorough hilling up of the young plants when they had four and five leaves on. In that crop I did not have ten per cent ponies. By pulling the young plants until they have six or eight leaves on, one can see just how they develop. Thin to two, or even one, to the hill; pinch off plants when thinning; do not pull out, it will disturb the growing plants. I have best results with one plant to the hill. Cultivate often, but farther away each time. After the fifth leaf appears, by all means do not disturb the surface roots. They are the only roots the vine has. You can pull up a grown vine and the first root that starts downward does not make much of a growth, but the surface roots spread on all sides, and in cultivating never turn the vines around out of the way, as that will cut off your supply of early cantaloupes, caused by the plow cutting off the surface roots. In irrigating one has to be governed by the kind of soil he has. It is fatal to soak the ground where soil "subs" good. One furrow on each side gets good results or one furrow to the row. I never could see much difference. The main thing is to irrigate before the soil gets too dry, and after the vines get to spreading over the ground one can see by the vines when they need water. The points will point upwards and have a slightly withered appearance.

The cucumber beetle, the rust and the aphis are enemies of the cantaloupe. The beetle may be checked by applying road dust. We have some success against the aphis with the ladybug. The rust is not prevalent. By planting rust-resistant seed one can overcome that disease to some extent. In marketing we are all up against it. I get best results by putting up a standard crate of forty-five melons to the crate, five in a row, three rows on the side of a crate.

Another size are ponies, fifty-four to the crate, six in the row. Pack good melons; wrap your own brand if shipping a long distance; use paper fifteen by fifteen. It will pay, as the loss is small and the appearance of the fruit will help to sell at a good price.

I have shipped crates of standard melons packed that way and sold for $9 in Denver.

In selling to commission houses select good reliable houses in each city to ship to, and stay with them acquainted. Visit them if in their town and you will find they will treat you right. I still ship to the same people I started in with. Don't ship a few to one house and then another in the same city. Show your commission man you have confidence in him, and don't expect him to get a fancy price for your stuff when you would not eat it yourself. Sell f. o. b. as much as possible. Melon associations are good to ship through. the main thing is to get good fruit, know when to get it and make a good pack.

In conclusion, will say: Have good ground, good seed, hoe shallow but well, cultivate often, get your surface roots started as soon as possible. Study the root system and you can raise from one hundred and fifty to three hundred crates to the acre, and mostly standards.

THE POTATO MOTH.

The damage due to the potato worm is often very serious, and for the past two years we have studied this insect and control methods. It has been demonstrated that the worms can be much reduced by a special system of planting and hilling. Also, slightly wormy tubers may be cleaned by a process of soaking in water. This treatment kills all the worms and makes long storage possible. The investigation of the potato moth is not yet complete and the remedies now known may still be improved upon.—W. H. Volck, Watsonville.

RANGING THE HOME GROUNDS.

EFORE building a house most ersons recognize the necessity of having a definite plan of the ure. Comparatively few peoowever, realize the desirability nning the home grounds. And e latter may have quite as to do with making a home as rmer.

a short article it is impossible e more than a few general prin-. These, if considered in their r relations to the situation of uilding and the character of the ndings, may lead to pleasing s. The location of walks and should be made a matter of nience. Neither the walks nor rives are ornamental in them-; hence, they should not be numerous than the uses of the life call for. Curved walks and are often more pleasing than ht ones, especially where the ds are large. The curves, howshould be easy and natural; not and kinky.

Them a Picture.

home grounds may be comwith a picture in which the forms the canvas, with the the principal center of interest. Viewed in this way the house should not be hidden behind a yardful of trees, but should at least, have the front facing an open stretch of lawn. Trees, if planted near the house, are preferably placed at the sides and rear, so as to form a setting and a background for it. The usual practice of planting several rows of trees running from the front of the house to the street is only conducive to monotony in effect, and furthermore, it is very difficult to establish and maintain a lawn under such circumstances.

The most appropriate places for large trees are along the boundaries of the grounds. The most pleasing way to place them is not in straight lines, but in groups, with lower-growing kinds in front and toward the center of the grounds. It is usually desirable partly to separate the back of the yard from the front. This is most pleasingly accomplished by placing one or two masses of low-growing trees and shrubs at the sides of the house and extending them to meet the masses planted at the sides of the yard. One or more openings should be left between the dividing masses of trees and shrubs for free passages and for the glimpses of the farther parts of the grounds. A stronger massing of trees and tall shrubs may be used in the proper position to shield the house from the prevailing winds.

By using a variety of trees with tall shrubs next, and smaller shrubs in front, a most effective wind break may be formed, and by planting the latter in irregular groups a much more pleasing effect is possible than where all are placed in formal rows. Wherever fine views of the distance are in danger of being shut off, openings should be left or made to retain them, especially such views as may be seen from porches and living room windows. Evergreen trees are most desirable on the north and west, because of their effective wind-break qualities in winter. They are not suitable trees for the south side of a house or in front of windows. In winter the sunshine should be given a free chance to enter the windows and thereby greatly add ont only to the cheerfulness of the rooms, but also to the lowering of the fuel bill.

Group the Plants.

The smaller shrubs and flowering annuals are best placed in the corners by the porches, along the base of the house wall and in front of the larger plants at the sides of the lawn. Groups of such plants on either side of the entrance gates are usually very pleasing. Avoid planting single shrubs or bushes or other plants promiscuosly about the lawn. The pleasing, distinctive character of a place can be secured only by leaving large open places where nothing but green grass is allowed to grow. If the whole place is dotted full of single specimens and small clumps, the effect is patchy and fussy, where it should be dignified and natural. Specimen plants, if used at all, should be planted sparingly and not set in the most conspicuous places.

Flower beds cut out of the lawn are best avoided. They break up the stretches of green, are difficult to keep in good condition, and leave unsightly bare spots in winter. Such flowering plants as are not suited for planting in the front of the shrubbery borders and about the porches are best kept in a flower garden at the rear or side of the house.—B. O. Longyear, Associate Professor of Botany, Colorado Agricultural College, Fort Collins.

A planting of 32,000 forest trees will be made back of Mentone. The trees will be taken from the forest nursery near Pasadena.

Imperial Valley Horticultural Commission is making an effort to keep phylloxera from that section.
